## ACKNOWLEDGEMENTS

The following students played an integral role in the development of this project. Jonathan Hawkins was our master programmer whose skill at designing and integrating the information was essential. Mike Benson continued the programming that Jonathan began during phase I of this project. Andrew Kay and Dong Gao also provided vital support with research and programming. Patrick Brennan and Karthik Rao Cavale conducted research during the first phase of this work. Staff from the New Jersey Department of Transportation, Southern Region, Maintenance Department, Larissa Poulber and Scott Oplinger assisted with providing valuable input to one of our case studies and the development of the maintenance module. Many thanks to Edward S. Kondrath, Jamie DeRose and Andy Swords for providing support for this work. We thank all for the guidance and input they provided for this project.

## EXECUTIVE SUMMARY

Volume I of this report summarizes the phase II development of the GASCAP software for analyzing the life-cycle greenhouse gas (GHG) emissions of transportation capital construction projects. GASCAP is a spreadsheet-based tool that has been designed to provide estimates of GHG emissions for the many different components of a construction project. It is designed to be both user-friendly and flexible, allowing the user to specify inputs for a variety of different modules. GASCAP provides life-cycle emissions estimates for the major GHGs. These include carbon dioxide $\left(\mathrm{CO}_{2}\right)$, methane $\left(\mathrm{CH}_{4}\right)$, nitrous oxide $\left(\mathrm{N}_{2} \mathrm{O}\right)$, sulfur hexafluoride $\left(\mathrm{SF}_{6}\right)$, and black carbon (BC). We also include estimates for the oxidation to $\mathrm{CO}_{2}$ of volatile organic compounds (VOC) and carbon monoxide (CO).

The primary modules within GASCAP provide estimates of embodied emissions associated with a wide range of materials, construction equipment used on a project site, emissions associated with project mobilization and traffic disruption based on how the project is staged, and life-cycle maintenance over the lifetime of the project. Other modules include procedures for using recycled materials, induced travel effects, and rail capital projects.

This phase of the GASCAP project focused on a variety of tasks. These included the development of the induced travel module, development of a life-cycle maintenance module, automated methods for allocating equipment to project types, development of procedures to estimate emissions associated with traffic disruption during project construction, various miscellaneous upgrades including development of $\mathrm{SF}_{6}$ emissions factors, upstream asphalt emissions factors associated with electricity, and incorporation of additional bid sheet item codes. Procedures were also included in Volume II of this report which will allow NJDOT staff to update emissions factors derived from the MOVES, NONROAD, and GREET models. This phase also included the development of four case studies that provided a test of the GASCAP software and also provided useful information for decision makers.

## Induced Travel Module

The induced travel module was developed to provide GHG estimates based on the traffic generated from new construction. As part of this work, we used New Jersey data to estimate models linking vehicle miles of travel to lane miles for different functional road classifications. These elasticities of travel demand, with respect to lane mileage, were then used to build the induced travel module.

## Life-cycle Maintenance Module

A life-cycle maintenance module was developed that provides estimates of emissions associated with road surface maintenance over the lifetime of a project. This module is based upon a maintenance schedule provided by NJDOT engineering staff. Both asphalt and concrete pavements can be modeled. Bridge maintenance activities are not
included in the module as information on typical maintenance activities was not supplied by NJDOT. The large variability in bridge types would in any case make generalizations about maintenance activities difficult for modeling purposes.

## Upgrades to Equipment Module

The first phase of GASCAP required users to input the equipment types and hours of usage for each project. In this phase of the work we examined various research projects and databases to determine methods for allocating equipment and its usage to a sample of the most common project types. A study conducted in California provided the best estimates for up to seven project types and the phases of construction work associated with each. The allocation method was implemented in GASCAP allowing the user to simply specify the length of the project and what type of project it is, greatly simplifying the task of inputting this information.

## Traffic Disruption and Diversion

In the first phase of GASCAP, a module was developed that provided options for staging of construction projects. This module focused on mobilization (i.e., movement of resources to the site) and options for providing project lighting powered by generators or the grid for nighttime work (a separate module developed in phase I can estimate GHG emissions from alternative street lighting options). In this phase we developed procedures that handle traffic disruption and diversion associated with the work site. The user is allowed to specify from seven different staging options, including the specification of a detour route around the work site. This allows the estimation of emissions associated with any disruption and diversion of traffic. Traffic flow equations from the Highway Capacity Manual provide the basis for determining changes in flow speeds, allowing changes in GHG emissions from a base case to be estimated.

## Miscellaneous Upgrades

Various minor upgrades of the software were also completed. These include development of $\mathrm{SF}_{6}$ emissions factors and upstream asphalt emissions factors associated with electricity usage. We also incorporated a large number of additional bid sheet items, primarily electrical components that were not included in phase I of this project.

## Case Studies

As part of this project we conducted four case studies, each of varying magnitude and with different objectives. One overall objective was to test the software and provide a demonstration of its capabilities. These case studies include one large comprehensive road reconstruction project (Rt 35 in Ocean County), one focused on the traffic disruption module (Rt 47 in Gloucester County), applied work done in cooperation with the maintenance staff of the South Region NJDOT office, and a fourth which demonstrated the ability to analyze embodied fuel costs associated with projects.

During the course of this work, we found various software bugs which were fixed and various minor omissions to GASCAP, including many item codes which could not be located. These would likely have a minor impact on total emissions calculated but might be worth including in any future update. Overall the case studies demonstrated that GASCAP is generally user-friendly and will provide useful information to project managers and decision makers.

We worked closely with the South Region office to develop a special maintenance module suitable to their needs. This was a useful exercise in that it showed a practical application of the software. Staff in the South Region office input various projects and provided the output of that work. These were for specific road maintenance tasks for crack sealing, manual patching, and a pothole killer. The latter cases may not have been correctly entered, suggesting additional training work may be necessary.

Both the large case study (Rt 35) and the traffic disruption case study (Rt 47) found that the bulk of emissions are associated with materials used in the road project. Many of the smaller components used on a project, when added together, also add non-trivial emissions to a project. The finding that it is mainly embodied emissions associated with materials that accounts for most emissions, limits the ability of NJDOT to influence the GHG emissions of most projects. Equipment emissions are a minor component. Staging procedures do show some variation depending on how a project is staged; in particular, total road closures will increase emissions substantially relative to intermittent closures (as shown with the Rt 47 case study). Nighttime lighting can also contribute substantial emissions to a project, but not enough to offset the emissions from a full road closure during the day.

Our fuel cost analysis showed that total embodied fuel costs may be a good proxy for total emissions. Lower cost projects likely have fewer total emissions than higher cost projects, mainly because fewer materials are used.

## Updating Procedures

The emissions factors which GASCAP uses in all phases of its calculations are derived primarily from three models. These are the EPA MOVES and NONROAD models for on-road vehicles and construction equipment, respectively, and the Argonne National Laboratory GREET models, for fuel cycle and vehicle cycle for embodied material emissions. Each of these models is periodically updated to reflect new research and changes in technology and regulations. For this reason, in Volume II of this report, we included our developed procedures and documentation that will allow NJDOT staff to update the output of these models.

## Future Research

As part of this work we investigated procedures for including road deterioration and how this affects the GHG emissions of vehicles using the road. This is potentially a large
source of emissions that is currently not accounted for in GASCAP. Resources were unavailable to implement a module that would account for this. This should be a priority for any future upgrades to GASCAP.

Various updates to different modules include automating the input of bid-sheet codes, more detailed research on equipment activity, possibly including a large survey of construction sites, and optimal life-cycle bridge maintenance procedures need to be developed by NJDOT and included in GASCAP.

Another issue is that GASCAP is now a fairly large and complex software product. Migration of the software to a platform more suitable to handle its complexities is recommended.

Finally, the case studies we conducted are just a start. We feel that far more work should be done to analyze various projects, both to test the software and to demonstrate its capabilities. Volume II of this report includes a GASCAP User Guide. Ideally NJDOT staff should be trained in how to use the software and policies should be put in place to integrate the use of the software within the planning process.

## APPENDIX A: <br> PROCEDURE FOR UPDATING EMISSIONS FACTORS FROM THE MOVES MODEL

This procedure requires the installation of EPA's MOVES software. Instructions are on EPA's website and these must be followed precisely. Details on how to extract emissions factors for GASCAP and how to update GASCAP are then provided.

## Software Installation

Download and install the latest available version of the MOVES software. The latest version is MOVES2010a. The software is published and made available at no cost by the EPA Office of Transportation and Air Quality (OTAQ). The software simulates emissions from on-road vehicles. A new version, currently scheduled for release in 2013 is expected to include non-road equipment as well and will replace the NONROAD procedure documented elsewhere in this users' guide. The MOVES webpage may be found at the following address.

## http://www.epa.gov/otaq/models/moves/index.htm

It is recommended that users wanting to update the portions of GASCAP that rely on the MOVES model read the general information, user documents and tools, and downloading instructions carefully. We urgently suggest that you follow the MOVES installation instructions to the letter. It will save considerable frustration. The installation has three components. First a Java platform is installed, followed by an SQL program named MySQL, and the finally the MOVES program itself. Care must taken to install the proper version of each component as recommended because the MOVES will not run otherwise. Please refer any problems you have with the MOVES installation to OTAQ.

## Extracting GASCAP Emission Factors from MOVES

The MOVES installation procedure should place three icons on your desktop, including MOVES Master, MOVES Worker, and MOVES Uninstall. Start the application by double clicking first on MOVES Worker and then on MOVES Master. Click OK on the popup dialog box when prompted to finish opening MOVES Master and complete the start up.

The first step is to enter run specifications. On the left column you will find a list of topics that require specification to run the program. A violet exclamation point indicates that a mandatory issue has not been satisfactorily specified and the program will not run until the problem is corrected. A wavy equals sign indicates that an issue that is not required has not been addressed. The program will run with the specification. A green check mark indicates that the specifications in question are satisfactory and the program will run. Begin to enter your specifications.

1. Click on the heading Geographic Bounds. Under Region click the State radial button. Under the States list click New Jersey and click the Add button. New

Jersey is listed under selections and a green check mark replaces the violet exclamation point to the left of Geographic Bounds.
2. Click on the heading Vehicles/Equipment. A subheading On Road Vehicles appears. Click on that as well. This will produce a list of selectable Fuels and Source Use Types (vehicle classifications). Click on Diesel fuel to select it and then while holding down the Control key click on gasoline. This will select diesel fuel and gasoline and none of the other options. Under Source Use Types click Select All. This will select all vehicle classifications and activate the Add Fuel/Type Combinations button. Click that and all of the fuel and vehicle type combinations will populate the Selections column. This will turn the violet exclamation points next to Vehicles/Equipment and On Road Vehicles into green check marks, indicating successful specification of equipment.
3. Next click on the Road Type heading. Select all of the road types except OffNetwork. The violet exclamation point next to the heading will turn into a green check mark, indicating successful specification of road types.
4. Click on the Pollutants and Processes heading. This will produce a matrix of check boxes associated with emissions and energy consumption categories and the processes, e.g. running exhaust, that produce them. Click on the following at the far left to include all processes:
a. Total Gaseous Hydrocarbons
b. Non-Methane Hydrocarbons
c. Non-Methane Organic Gases
d. Carbon Monoxide
e. Primary PM10 - Elemental Carbon
f. Primary PM2.5 - Elemental Carbon
g. Total Energy Consumption
h. Petroleum Energy Consumption
i. Fossil Fuel Energy Consumption
j. Methane
k. Nitrous Oxide
I. Atmospheric $\mathrm{CO}_{2}$, and
m. $\mathrm{CO}_{2}$ Equivalent

Uncheck Evap Permeation, Evap Fuel Vapor Venting, and Evap Fuel Leaks for Total Gaseous Hydrocarbons, Non-Methane Hydrocarbons, and Non-Methane Organic Gases. The violet exclamation point to the left of the Pollutants and Processes heading will turn into a green check mark, indicating that the specifications are acceptable.
5. Click the Time Spans heading. This will produce an input table that asks the user to indicate a Time Aggregation Level, Years, Months, Days, and Hours. Click Year as the aggregation level. This automatically selects all months, days and hours. Select a year [one year at a time is recommended by VTC staff] and click Add. The year will appear in the Years: box and the violet exclamation point next to the Time Spans heading will turn into a green check mark.
6. Click the Output heading. Two subheadings will appear: General Output and Output Emissions.
a. Click General Output. Leave the Server box blank to write the data query results locally. In the Database box, enter a database name that you can remember easily and click the Create Database button. A popup message will tell you "Output Database successfully created." Click OK in it to dismiss it. Under units select grams for mass units, Million Btu for energy units and miles for distance units. Under Activity select distance traveled to state outputs in vehicle miles traveled (VMT). The General Output heading has a green check.
b. Click Output Emissions. Select Model Year and Fuel Type, but not emission process. This will allow you to avoid needless aggregation in the post processing and table manipulation phases of this process. Do not make any changes to the Always section. Under the On Road section select only SCC. SCC codes indicate both functional classification of roads and fuel type.
7. Check to make sure that there are no violet exclamation marks showing on the left margin of MOVES. Address any there are by reviewing this protocol.

The second step is to run the specifications. To do this:

1. Under the Action menu of MOVES select Execute. You will be prompted to save your script. Click Yes and enter a text file name for the script. When you save this MOVES starts processing.
2. Wait until the Execute active RunSpec bar crosses the bottom of the screen. This will take some time regardless of the speed of your computer although run times will vary.
3. When the run finishes under the Action menu select MOVES Run Error Log. It should be empty. If not troubleshoot as necessary. Email can be sent to mobile@epa.gov.
4. Under the Post Processing Menu select Run MySQL Script on Database. Select TabbedOutput.spq and click OK. Read the Post-processing Script Documentation and click OK. Another popup will say "Post processing script executed successfully." Click OK on it.
5. Close MOVES by clicking on the $X$ buttons in the upper right hand corner of MOVES Master and MOVES Worker.

The third step is to open the run results into Excel. The emissions and energy use covered in the MOVES data are complete with the exception of $\mathrm{N}_{2} \mathrm{O}$ emissions. These data are provided by SCC codes including gasoline and diesel vehicles. SCC Codes have three components. The first is seven digits long (digits 1-7) and describes the vehicle type including the type fuel used. The seven-digit codes in Table 1are used in the data produced by the MOVES model described above:

Table 1 - Vehicle types in the MOVES model

| SCC | Description | Abbreviation |
| :--- | :--- | :--- |
| 2201001 | Light Duty Gasoline Vehicles | LGDV |
| 2201020 | Light Duty Gasoline Trucks 1\&2 | LDGT1 |
| 2201040 | Light Duty Gasoline Trucks 3\&4 | LDGT2 |
| 2201070 | Heavy Duty Gasoline Vehicles 2B--8B and Gasoline Buses | HDGV2B |
| 2201080 | Motorcycles | MC |
| 2230001 | Light Duty Diesel Vehicles | LDDV |
| 2230060 | Light Duty Diesel Trucks 1--4 | LDDT12 |
| 2230071 | Heavy Duty Diesel Vehicles Class 2B | HDDV2B |
| 2230072 | Heavy Duty Diesel Vehicles Class 3, 4, and 5 | HDDV4 |
| 2230073 | Heavy Duty Diesel Vehicles Class 6 and 7 | HDDV6 |
| 2230074 | Heavy Duty Diesel Vehicles Class 8A and 8B | HDDV8A |
| 2230075 | Heavy Duty Diesel Buses (School and Transit) | HDDBT |

The second component has two digits (digits 8-9) and describes the functional class of roads where emissions were produced. These codes are used to assess added emissions from increased use because of additions of lane miles of specific road types in the induced travel component of GASCAP. The two-digit functional class codes shown in Table 2 are taken from the SCCs produced in the MOVES run described above, are used to aggregate the GASCAP functional classifications from the SCCs produced in the MOVES run described above:

Table 2 - Functional classification codes in MOVES and GASCAP usage

| SCC | SCC Designation | GASCAP Designation | GC Code |
| :---: | :---: | :---: | :---: |
| 00 | Off Network (Exhaust) | Off Network (for deletion) | -- |
| 00 | All Functional Classes Combined (Evaporation) | All Combined | -- |
| 11 | Rural Interstates | Interstates and Freeways | _1 |
| 13 | Rural Principal Arterials | Arterials | 2 |
| 15 | Rural Minor Arterials | Arterials | 2 |
| 17 | Rural Major Collectors | Collectors | -3 |
| 19 | Rural Minor Collectors | Collectors | _3 |
| 21 | Rural Local Roads | Local Roads | -4 |
| 23 | Urban Interstates | Interstates and Freeways | _1 |
| 25 | Urban Freeways and Expressways | Interstates and Freeways | _1 |
| 27 | Urban Major Arterials | Arterials | _2 |
| 29 | Urban Minor Arterials | Arterials | _2 |
| 31 | Urban Collectors | Collectors | _3 |
| 33 | Urban Local Roads | Local Roads | _4 |

The third and final component of the SCC codes is a single character in the tenth place. An ' $X$ ' indicates that the record represents exhaust emissions while a ' $V$ ' indicates evaporative emissions. The other emission type codes ' $B$ ' for brake wear and ' $T$ ' for tire wear are not modeled for GASCAP.

A ten-character SCC code classifies modeled emissions by vehicle type, functional classification of roads, and emission type. For example the SCC code 220100121X indicates exhaust emissions from light-duty gasoline vehicles on rural local roads. The SCC code $22307500 V$ indicates evaporative emissions from diesel buses. Please note that evaporative emissions are not modeled by road functional classification. This makes it necessary to apportion evaporative emissions among functional classifications so that evaporative and exhaust emissions can be combined for the induced travel component of GASCAP. The SCC code 223006000X indicates exhaust emissions from
light duty diesel trucks off-network, which are not included in GASCAP and may be deleted. Although SCC codes discriminate completely among fuel types, there is a separate fuel indicator, which is not used in the Excel manipulations described here. In addition, emissions are disaggregated by model year.

## Data manipulation conventions in Excel

Microsoft Excel provides a reasonable way to accomplish the data manipulations. Anyone who has ever worked with databases or worked with Excel will find this portion quite familiar. A spread sheet such as Excel is a workable medium for a database because it is composed of cells which can be referenced by row and column. In Excel rows are referenced by integers (whole numbers) from 1 to $1,048,576$ and columns are referenced by capital letters alone or in combination from A to XFD (16,384 possible columns). The order of column letters is one-letter, two-letter, and three-letter, each in alphabetical order. Each cell in a database is a member of a row or record, which contains all of the information about a particular instance in the data, such as 223006019X (exhaust emissions for light-duty diesel trucks on rural minor collectors). Each cell in a database also contains a column or variable, which contains a particular piece of information about all of the records in the database, such as $\mathrm{CO}_{2}$ or grams of $\mathrm{CO}_{2}$ emissions. Row 1 contains the name of each variable. Each cell below the label cell in Row 1 contains the datum specified by the label name for its particular row. Data are contained in rows 2 through list, where list refers to the last row in a table for which there are data. When a variable is added or changed usually changes are done in rows from 2 to list.

ID variables have names that may be unique within their column or may contain names that are unique in a more highly aggregated database with fewer members. An example might be the concatenation of SCC and model year such as 220102025_1986, which identifies the record as emissions from 1986 light-duty gasoline trucks on urban freeways and expressways. By using an ID variable at a higher level of aggregation so that the contents are not unique, it is possible to access information from other tables that are aggregated at the level of aggregation indicated by the name. Most of the tables where the data manipulations take place have at least two ID variables. One is unique to the table and the other or others are unique to tables of data that are more aggregated or generalized than the table in which they are found.

Some of the Excel worksheets discussed in this documentation contain multiple tables or databases. For the sake of clarity these are referred to as subtables. Tables are alone on a worksheet while subtables share a worksheet however they are conceptually independent of each other except in specified ways. Each can have different variables and variable names, usually based on different levels of aggregation because the emissions and energy consumption variables are consistent. This means that there are different numbers of records. To avoid confusing them, subtables are separated by blank columns.

After a formula has been entered in Row 2 under the variable label, it must be copied to the other cells in the column for which there is data. The easiest way to accomplish this is to select those cells and the cell in Row 2 that already has data. Then by pressing the Control and D keys together the formula is copied and the column is populated. To do this the last row to receive data must be found. If there is already the correct number of populated cells in the column the bottom may be found by simultaneously pressing Shift-Control-Down Arrow with the cell in Row2 selected. If the column is not populated find a column that is populated--ID variables should always be populated--and press Control-Down Arrow to find the last row. Select the cell in the last row and in the column to be populated and Press Shift-Control-Up Arrow to select the column. Then press Control-D to populate. Multiple columns can be populated simultaneously by selecting the cells in Row 2 or Row last and proceeding as just described.

In Excel formulas cell references are relative. If an Excel formula references cell A1 from cell B1 and the formula is copied to cell C1 the formula will reference cell B1 (one cell to the left). If the formula is copied to cell B2 the formula will reference cell A2. If the formula is copied anywhere in Column A an error message is produced because the formula references a column that does not exist. The dollar sign ('\$') is used before a column letter or a row number to make the reference absolute and independent of movement of the formula to another cell. If an Excel formula references cell \$A1 the formula copied to another cell will reference Column A and whatever row the cell is copied to. If the formula references $\mathbf{A} \$ 1$ the copied formula will reference Row 1 and whatever column the cell is copied to. If the formula references $\$ A \$ 1$ the formula will reference cell A1 wherever it is copied. This is important to this GASCAP update procedure because cells reference a fixed range of row numbers within columns (Row 2 to Row last). The following formulas take the general form that should be used to populate a single column with look up functions:
$=\mathrm{vlookup}\left(\mathrm{R} 2, \mathrm{~V} \$ 2: \mathrm{AB}\right.$ /ast, $\mathrm{k}^{1}$, false)=sumif(Q\$2:Q\$last, $\left.\mathrm{R} 2, \mathrm{~S} \$ 2: \mathrm{S} \$ / a s t\right)$

These formulas will reference the correct row members in the columns they search and read from but will search the correct criterion in each cell because the criteria remain relative references. The following formulas take the general form that should be used to populate multiple columns with look up functions:
$=$ vlookup(\$R2,\$V\$2:\$AB\$/ast, $\mathrm{x}^{2}$, false)=sumif(\$Q\$2:\$Q\$/ast, \$R2, S\$2:S\$/ast )

Vlookup is only used for single variables and is not discussed further. Sumif is used to aggregate multiple emissions and energy consumption variables. The columnar references in the sumif formula above are absolute for the search range and the criterion so that the ID variable and criterion are always referenced. The sum range

[^0]references are relative so that each variable is added to the correct column in the more highly aggregated subtable, i.e. if Column X references Column G then Column Y should reference Column H and so on.

A final note about how this procedure uses Excel involves copying and pasting cell contents. A simple copy and paste procedure, i.e. Select Contents, Control-C, Select Destination, and Control-V transfers cell contents including formulas with relative and absolute references. This procedure uses more memory than if the cell contents were copied as text, and is prone to unintended and unfortunate consequences. This is unnecessary if the cell contents should be permanent. This can be avoided using Excel's paste special-values procedure, i.e. Alt followed in turn by E, S, V, and entered by pressing the Enter key or clicking the OK button. This procedure is used extensively.

## Data manipulation of MOVES output

To prepare the data for incorporation into the GASCAP model evaporative emissions must be combined with exhaust emissions and $\mathrm{N}_{2} \mathrm{O}$, which results from exhaust but is handled separately by MOVES, must be aggregated. Since on-road exhaust emissions, evaporative emissions and $\mathrm{N}_{2} \mathrm{O}$ emissions are all aggregated at different levels, it is necessary to separate these into three working tables, then aggregate the component that has the most detailed level of aggregation to the levels of aggregation of the other components. Exhaust emissions are aggregated by vehicle type, fuel type, off-road and on-road use by functional classification, and vehicle model year. To aggregate exhaust emissions to the same level as evaporative emissions, functional classifications and offroad activity must be combined so that aggregation is by vehicle type, fuel type, and model year. To attribute $\mathrm{N}_{2} \mathrm{O}$ emissions the exhaust emissions must be further aggregated to match the aggregation level of $\mathrm{N}_{2} \mathrm{O}$ emissions. This means that SCC codes must be combined so that aggregation is at the fuel type and model year level.

At this highest level of aggregation $\mathrm{N}_{2} \mathrm{O}$ emissions are read from the $\mathrm{N}_{2} \mathrm{O}$ table to the matching exhaust emissions subtable using a vlookup formula. $\mathrm{N}_{2} \mathrm{O}$ emissions are then disaggregated based on the fraction of total energy consumption for each vehicle type within each fuel type, by model year. $\mathrm{N}_{2} \mathrm{O}$ emissions are further disaggregated based on the fraction of total energy consumption for each functional classification (road type) within each vehicle type, by model year.

Three measures of evaporative emissions, i.e. non-methane hydrocarbons (NMHC), non-methane organic gases (NMOG), and total hydrocarbons (TotalHC) are read from the evaporative emissions work sheet, and added with the corresponding categories of exhaust emissions at the stage where final tables are produced. This is done at the vehicle type and model year level.

MOVES will have produced three tab-delimited text files on your desktop assuming that is where the MOVES icons are located, as follows:

- SummaryReportHeader.tab
- SummaryReportDecode.tab, and
- SummaryReportBody.tab

The following steps should then be followed:

1. Move these files to your working directory.
a. Open all three tab delimited text files into Excel as three separate worksheets. When all three files are open combine them into a single workbook.
2. Create Exhaust, Evaporation and $\mathrm{N}_{2} \mathrm{O}$ working files by doing the following:
a. Right click the SummaryReportBody worksheet at the bottom of the Excel workbook. Select Move or Copy from the pull down menu. Check the Create a Copy box in the Move or Copy popup menu, click Move to End and click OK.
b. Rename the file to indicate that it is an exhaust emissions working file. Right click its tab at the bottom of the workbook and select rename from the pulldown menu. The text in the tab will be highlighted, which means that it is editable. Type in a name that indicates the purpose of the file such as "Work Exhaust" and press Return.
c. Duplicate the Exhaust work worksheet using the procedure described in 4a, above. Name the new worksheet to indicate that its purpose is to be a working area for evaporative emissions with a name such as "Work Evap."
d. Duplicate the Evaporative work worksheet using the procedure described in 4a, above. Name the new worksheet to indicate that its purpose is to be a working area for $\mathrm{N}_{2} \mathrm{O}$ emissions with a name such as "Work $\mathrm{N}_{2} \mathrm{O}$."

## Prepare the $\mathrm{N}_{2} \mathrm{O}$ Working File

1. Delete all non- $\mathrm{N}_{2} \mathrm{O}$ records from the $\mathrm{N}_{2} \mathrm{O}$ work worksheet. $\mathrm{N}_{2} \mathrm{O}$ records are aggregated by fuel type ( 1 for gasoline and 2 for diesel) and do not have SCC data. The remaining records all have valid data in the $\mathrm{N}_{2} \mathrm{O}$ column.
2. Delete unnecessary columns in the $\mathrm{N}_{2} \mathrm{O}$ worksheet. Select and delete columns labeled Run through $\mathrm{CH}_{4}$ (six columns).
3. Create a unique ID variable for the $\mathrm{N}_{2} \mathrm{O}$ table. Select Column A by clicking on the letter above Row 1. Right click and choose Insert. Type the label "FuelYr" in Cell A1. In Cell A2 type the following formula and press Enter:
=concatenate([Fuel]2,"_",[ModelYr]2)

This will combine a one-digit fuel code with a four-digit model year separated by an underscore, e.g. 1_2000 (which indicates emissions from year 2000 gasoline engines. Populate the column.
4. Save the Workbook.

## Prepare the Exhaust Emissions Working File

1. Delete all $\mathrm{N}_{2} \mathrm{O}$ records from the exhaust worksheet.
2. Delete all evaporative records from the exhaust worksheet.
a. Select the three columns to the right of the SCC column.
b. Right click anywhere in the selection and choose insert. Three blank columns will appear.
c. Label them by typing "Vehicle Type" in Row 1 of the first new column, "Road Type" in Row 1 of the second new column and "Emissions Type" in Row 1 of the third new column.
d. In Row 2 of the Vehicle Type column type the following:
$=\operatorname{left}\left([S C C]^{3} 2,7\right)$
e. In Row 2 of the Road Type column type the following:
$=\operatorname{right}(\operatorname{left}([S C C] 2,9), 2)$
f. In Row 2 of the Emission Type column type the following:
$=\operatorname{right}([S C C] 2,1)$

[^1]g. Select all the cells in the Vehicle Type column, the Road Type column and the Emissions Type column from Rows 2 to last. Populate the three columns.
h. Remove the formulas by keep the selection and copying (Control-C) and pasting special with values.
i. Sort the worksheet by Emissions Type. As a result evaporative emissions ('V') are sorted ahead of exhaust emissions (' $X$ ').
j. Delete all records with V as the emission type.
3. Create a unique ID variable for the exhaust worksheet. Select Column A, rightclick anywhere in the selection and choose insert. Type VTRTMY (Vehicle Type, Road Type, and Model Year) in Cell A1. This is a label not only for the column but also for the table, which will become a subtable when other subtables are added to the exhaust worksheet. Enter the following formula into Cell A2:
=concatenate([Vehicle Type]2,",",,[Road Type]2,",",[ModelYr]2)

The result should be "2201001_00_1982" for emissions for light-duty gasoline vehicles driven off-network assembled in 1982. Select a cell in Column B navigate to the bottom by typing Control-Down Arrow. Populate the column.
4. Save the file.

## Prepare the Evaporative Emissions Working File

1. Delete all $\mathrm{N}_{2} \mathrm{O}$ records from the evaporative worksheet.
a. Delete all exhaust records from the evaporative worksheet.
b. Select the column to the right of the SCC column.
c. Right click anywhere in the selection and choose insert. A blank column will appear.
d. Label it by typing "Emissions Type" in Row 1 of the new column.
e. In Row 2 of the Emission Type column type the following:

$$
=\operatorname{right}\left([\mathrm{SCC}]^{4} 2,1\right)
$$

f. Select all of the cells in the Emissions Type column from Rows 2 to last and populate them.
g. Sort the worksheet by Emissions Type. As a result evaporative emissions (' $V$ ') are sorted ahead of exhaust emissions (' $X$ ').
h. Delete all records with $X$ as the emission type.
2. Create a unique ID variable. Select Column A, right-click anywhere in the selection and choose insert. Type VTMY (Vehicle Type and Model Year) in Cell A1. This is a label not only for the column but also for the table. In Cell A2 type the following formula:
=concatenate(left([SCC]2,7),"_",[ModelYr]2)

The result would be "2201001_1982" for emissions from a light-duty gasoline vehicle assembled in 1982. Populate the column.
3. Save the file.

## Aggregation of the Exhaust Emissions Subtables

## Vehicle Type by GASCAP Functional Classification by Model Year

1. Click on the Exhaust worksheet.
2. Create a new variable to allow aggregation to the functional classifications used in the Induced Travel Module of GASCAP. Click on the cell to the right of the blank Distance label (in Row 1). Type GCRT (GASCAP Road Type). Enter the following formula in the cell in Row 2 :
=IF([ROAD TYPE]2="00","0",IF(OR([ROAD TYPE]2="11",[ROAD TYPE]2="23",
[ROAD TYPE]2="25"),"1",IF(OR([ROAD TYPE]2="13",[ROAD TYPE]2="15",
[ROAD TYPE]2="27",[ROAD TYPE]2="29"),"2",IF(OR([ROAD TYPE]2="17",
[ROAD TYPE]2="19",[ROAD TYPE]2="31"),"3",IF(OR([ROAD TYPE]2="21",

[^2][ROAD TYPE]2="33"),"4","ERROR")))))

This will convert MOVES detailed Road Types to GASCAP as shown previously in Table 2. Populate the column. Check for errors and correct the formula as necessary.
3. Create an ID variable that is vehicle type by GASCAP functional classification by model year (VTGCMY). In the cell in Row 1 to the right of the GCRT column and type VTGCMY. In the cell in Row 2 of that column type the following formula:
=concatenate([Vehicle Type]2,",",[GCRT]2,",",[ModelYr]2)

Populate the column.
4. Copy VTGCMY and Paste Special Values and sort to create an ID variable for a new subtable. Change the column label to VTGCMY2.
5. Remove duplicate records from VTGCMY2 to make the ID variable unique. In the cell to the right of [VTGCMY2. VTGCMY2]2 (the cell in Row2 of the ID variable of the new subtable VTGCMY2), type the following formula:
$=\mathrm{if}([\mathrm{VTGCMY} 2 . \mathrm{VTGCMY2]2=[VTGCMY2}. \mathrm{VTGCMY2]1,0,1)}$

This formula tests to see if each data cell in the column is the same as the cell directly above it and assigns a 0 if it is a duplicate and a 1 if not. Populate the column with this formula. Copy the selection and paste special values (Alt followed in turn by E, S, V, return) to remove the formulas so that values in the temporary column are not changed by sorting. Select Column [VTGCMY2. VTGCMY2] and the temporary column and sort by the temporary column. Find the first non-duplicated (=1) in the temporary column. Select all duplicate cells in the [VTGCMY2. VTGCMY2] column and the temporary column and delete them. Select and delete the temporary column.
6. Save the file.
7. Create labels for subtable VTGCMY2. From subtable VTRTMY copy the labels for emissions, energy consumption, and VMT ([VTRTMY.CO2]1 through [VTRTMY.Distance]1). Paste one cell to the right of the label for the ID variable in subtable VTGCMY2 (one cell to the right of [VTGCMY2. VTGCMY2]1).
8. Aggregate data from subtable VTRTMY into subtable VTGCMY2. In the cell in Row 2 of the $\mathrm{CO}_{2}$ column ([VTGCMY2.CO2]2) type the following formula:

```
=sumif($[VTRTMY. VTGCMY]$2:$[VTRTMY.VTGCMY]$last5, $[VTGCMY2.
VTGCMY2]2, [VTRTMY.CO2]$2:[VTRTMY.CO2]$/ast)}\mp@subsup{}{}{6
```

This formula will search column [VTRTMY. VTGCMY] for records in subtable VTRTMY from the first $($ Row $=2)$ to the last (Row $=l a s t)$ data record that match records in column [VTGCMY2. VTGCMY2] and sums the results of the $\mathrm{CO}_{2}$ emissions variable in matching records. Dollar signs before row references in the search and sum ranges make the row references absolute so that Rows 2 through last are consistently referenced as other members of the VTGCMY2.CO2 column are populated. The Dollars signs before the column references in the search range and the specified criterion cell make the column references absolute so that as the formula is moved to other columns comparisons are still made between the ID variables.
9. Populate the VTGCMY2.CO2 column. Click a cell in VTGCMY2.VTGCMY2 and press Control-Down Arrow to navigate to the bottom of the subtable. Click [VTGCMY2.CO2]/ast, press Shift-Control-Up Arrow to select the data cells and press Control D to populate.
10. Populate columns [VTGCMY2.CO2_Equiv] through [VTGCMY2.Distance]. Using Shift-Right Arrow select the columns [VTGCMY2.CO2_Equiv] through [VTGCMY2.Distance]. Press Control-R to populate each column from the $\mathrm{CO}_{2}$ column.
11. Type VMT into [VTGCMY2.Distance]1 to rename the [VTGCMY2.Distance] column [VTGCMY2.VMT].
12. Type Energy_prop one cell to the right of [VTGCMY2.VMT]1 to name a blank column that will be populated later. This column will hold the proportion of total energy that each record holds and will form a basis for attributing evaporative and $\mathrm{N}_{2} \mathrm{O}$ emissions.
13. Type VTMY one cell further to the right (two cells to the right of [VTGCMY2.VMT]1) to name an ID variable for the next level of aggregations. This one is aggregated by vehicle type and model year. It will allow one to one comparison with evaporative emissions and combination of exhaust emissions, except $\mathrm{N}_{2} \mathrm{O}$, with evaporative emissions. Type the following formula into Row 2 ([VTGCMY2.VTMY]2):
=concatenate(left([VTGCMY2.VTGCMY2]2,7),"_",right([VTGCMY2. VTGCMY2]2,4))

Populate the column.

[^3]14. Save the file.

## Vehicle Type by Model Year

1. Copy Column VTGCMY2.VTMY, paste special values and sort to create an ID variable for a new subtable. Change the column label to VTMY3.
2. Remove duplicate records from VTMY3 to make the ID variable unique. In the cell to the right of [VTMY3. VTMY3]2 (the cell in Row2 of the ID variable of the new subtable VTMY3), type the following formula:
$=i f([\mathrm{VTMY3} . \mathrm{VTMY3}] 2=[\mathrm{VTMY3} . \mathrm{VTMY3}] 1,0,1)$

Populate the column with this formula. Copy the selection and paste special values (Alt followed in turn by E, S, V, return) to remove the formulas so that values in the temporary column are not changed by sorting. Select Column [VTMY3. VTMY3] and the temporary column and sort by the temporary column. Find the first non-duplicated (=1) in the temporary column by selecting the temporary column. Select all duplicate cells in the [VTMY3. VTMY3] column and the temporary column and delete them. Select and delete the temporary column.
3. Save the file.
4. Create labels for subtable VTMY3. From subtable VTGCMY2 copy the labels for emissions, energy consumption, and VMT ([VTGCMY2.CO2]1 through [VTGCMY2.Energy_prop]1]. Paste one cell to the right of the label for the ID variable in subtable VTMY3 (one cell to the right of [VTMY3. VTMY3]1).
5. Aggregate data from subtable VTGCMY2 into subtable VTMY3. In the cell in Row 2 of the $\mathrm{CO}_{2}$ column ([VTMY3.CO2]2) type the following formula:
=sumif(\$[VTGCMY2. VTMY]\$2:\$[VTGCMY2.VTMY]\$lastT,\$[VTMY3.VTMY3]2, [VTGCMY2.CO2]\$2:[VTGCMY2.CO2]\$/ast) ${ }^{8}$

As previously, dollar signs before row references in the search and sum ranges make the row references absolute so that Rows 2 through last are consistently referenced as other members of the VTMY3.CO2 column are populated. The Dollars signs before the column references in the search range and the specified criterion cell make the column references absolute so that as the formula is moved to other columns comparisons are still made between the ID variables.

[^4]6. Populate Column [VTMY3.CO2]. Select any cell in [VTMY3.VTMY3] and navigate to the bottom of the subtable by pressing Control-Down Arrow. Select [VTMY3.CO2]/ast (one cell to the right of [VTMY3.VTMY3]/ast) and press Shift-Control-Up Arrow. Populate by pressing Control-D.
7. Populate columns [VTMY3.CO2_Equiv] through [VTMY3.VMT]. Using Shift-Right Arrow select the columns [VTMY3.CO2_Equiv] through [VTMY3.VMT]. Press Control-R to populate each column from the $\mathrm{CO}_{2}$ column. Column [VTMY3.Energy_prop] is left blank.
8. Type FTMY one cell to the right of [VTMY3.Energy_prop]1) to name an ID variable for the next level of aggregations. This one is aggregated by fuel type and model year. It will allow one to one comparison with $\mathrm{N}_{2} \mathrm{O}$ emissions and combination of exhaust emissions. Type the following formula into Row 2 ([VTMY3.FTMY]2):
=concatenate(if(left([VTMY3.VTMY3]2,3)="220",1,2)," ",right([VTMY3. VTMY3]2,4))

Populate the column.
9. Save the file.

## Fuel Type by Model Year

1. Copy Column VTMY3.FTMY, paste special values and sort to create an ID variable for a new subtable. Select and copy the whole VTMY3.FTMY column by clicking the letter above the cell in Row 1 is an easy way. Select the column two cells to the right and paste special values (Alt followed in turn by E, S, V, return). While it is still selected sort the column alone. Click on the Sort icon in the Data menu. Make sure the "My data has headers" box is checked and that the Order is A to Z. Click OK. Change the column label to FTMY4.
2. Remove duplicate records from FTMY4 to make the ID variable unique. In the cell to the right of [FTMY4. FTMY4]2 (the cell in Row2 of the ID variable of the new subtable FTMY4), type the following formula:
$=i f([F T M Y 4$. FTMY4]2=[FTMY4. FTMY4]1,0,1)

Populate the column with this formula. Copy the selection and paste special values (Alt followed in turn by E, S, V, return) to remove the formulas so that values in the temporary column are not changed by sorting. Select Column [FTMY4. FTMY4] and the temporary column and sort by the temporary column. Find the first non-duplicated cell
(=1) in the temporary column. Delete the duplicate cells. Select and delete the temporary column.
3. Save the file.
4. Create and populate the $\mathrm{N}_{2} \mathrm{O}$ and VMT columns of subtable FTMY4. Type N2O into Row 1 of the column one cell to the right of Column [FTMY4.FTMY4] and type TotalEnergy into Row1 of the column one cell to the right of Column [FTMY4.N2O]. In the Row 2 cell of Column [FTMY4.N2O] type the following formula to read from the table in the N2O worksheet:
=vlookup([FTMY4.FTMY4]2,[N2OWorksheet.Fuel Yr]\$2:
[N2OWorksheet.N2O]\$/ast, columns([N2OWorksheet.Fuel Yr]\$2: [N2OWorksheet.N2O]\$/ast),false) ${ }^{9}$

This formula will search the data in first column of the N2O worksheet and assign from the last column. To populate the column click on any cell in Column [FTMY4.FTMY4], press Control-Down Arrow, Right Arrow one cell and press Shift-Control-Up Arrow followed by a Control-D.

In Row 2 cell of the [FTMY4.TotalEnergy] Column enter the following formula:
=SUMIF([VTMY3.FTMY]\$2:[VTMY3.FTMY]\$/ast,[FTMY4.FTMY4]2,[VTMY3. TotalEnergy]\$2:[VTMY3. TotalEnergy]\$/ast) ${ }^{10}$
to aggregate total energy at the fuel and model year level from subtable VTMY3. To populate the column click on any cell in Column [FTMY4.FTMY4], press Control-Down Arrow, Right Arrow two cells and press Shift-Control-Up Arrow followed by a Control-D.
5. Save the file.

## Disaggregate $\mathrm{N}_{2} \mathbf{O}$ Emissions

1. Estimate the share of total energy within fuel type by model year by dividing total energy at the vehicle type and model year level by total energy at the fuel type and model year level. To do this enter the following formula into the cell in Row 2 of the [VTMY3.Energy_prop] Column:

[^5]=[VTMY3.TotalEnergy]2/vlookup([VTMY3.FTMY]2,[FTMY4.FTMY4]\$2: [FTMY4.
TotalEnergy]\$/ast, 3,false)

Populate the column.
2. Disaggregate $\mathrm{N}_{2} \mathrm{O}$ to the vehicle type and model year level by multiplying the [VTMY3.Energy_prop] Column by $\mathrm{N}_{2} \mathrm{O}$ emissions in subtable FTMY4. Use the following formula in the cell in Row 2 of Column [TOTAL ENERGYMY3.N2O]:
= [VTMY3.Energy_prop] * vlookup([VTMY3.FTMY]2, [FTMY4.FTMY4]\$2:
[FTMY4.N2O]\$/ast, 2, false)

Populate the column.
3. Estimate the share of total energy within vehicle type by model year by dividing total energy at the vehicle type, GASCAP functional classification and model year level by total energy at the vehicle type and model year level. To do this enter the following formula into the cell in Row 2 of the [VTGCMY2.Energy_prop] Column:
=[VTGCMY2.TotalEnergy]2/vlookup([VTGCMY2.VTMY]2,[VTMY3.VTMY3]\$2:
[VTMY3.TotalEnergy]\$last, 7,false)

Populate the column.
4. Disaggregate $\mathrm{N}_{2} \mathrm{O}$ to the vehicle type, GASCAP functional classification, and model year level by multiplying the [VTGCMY2.Energy_prop] Column by $\mathrm{N}_{2} \mathrm{O}$ emissions in subtable VTMY3. Use the following formula in the cell in Row 2 of Column [VTGCMY2.N2O]:
= [VTGCMY2.Energy_prop] * vlookup([VTGCMY2.VTMY]2, [VTMY3.VTMY3]\$2:
[VTMY3.N2O]\$last, 7, false)

Populate the column.
5. Save the file.

## Final Output Tables

## Output Tables for Input to the Staging and Transportation Modules

1. Create a new worksheet. From the exhaust worksheet, right click and select Insert. Click on the worksheet icon, and click OK or press Return. Right click the
new module and select Rename. Type "Transport Module" in the tab at the bottom of the page.
2. Copy and Paste Special Values the VTMY3 subtable to the induced travel worksheet just created. Click on the exhaust worksheet.
3. Aggregate evaporative and exhaust emissions for the [NMHC], [NMOG], and [TotalHC]. Type the following formula into the cell in Row 2 of the [NMHC] Column of the Transport Module table:
=vlookup([Transport Module.\$VTMY3]2,[Evaporative Worksheet.\$VTMY]\$2:
\$[TotalHC]\$last, columns([Evaporative Worksheet.\$VTMY]2:[NMHC]2),false) +vlookup([Transport Module.\$VTMY3]2,[Exhaust Worksheet.\$VTMY3]\$2: \$[TotalHC]\$last, columns([Exhaust Worksheet.\$VTMY3]2:[NMHC]2),false)

Populate the rest of the column. Copy the column and Paste (NOT Paste Special) into [Transport Module.NMOG]2, and [Transport Module.TotalHC]2. This will populate those columns as well.
4. Divide everything by VMT to express emissions and energy consumption on a per VMT basis. Copy the labels in Row 1 and Paste them to the Row 1 of the second column to the right of [VMT]. Copy and Paste Column VTMY3 into the first column of the new subtable. Type "VTMYperVMT" into Row 1 of the first column in the new subtable. Delete (clear) [VMT] from the new subtable. In Row 2 of Column [VTMYperVMT.CO2] type the following formula:
=[Transport Module.VTMY3.CO2]2/[Transport Module.VTMY3.\$VMT]2
Navigate to the bottom of the subtable. Press Right Arrow to select the last cell in VTMYperVMT.CO2, then press Shift-Control-Up Arrow and press Control-D. Make the Label in Row 1 visible. (Pressing Shift-Up Arrow followed by ShiftDown Arrow works). While holding down the Shift key press Right Arrow to select all columns through [VTMYperVMT.TotalHC] and press Control-R to populate. Copy and Paste Special Values (Alt, E, S, V) to remove formulas. Keep the VTMY3 subtable to add evaporative emissions to the Induced Travel table.
5. Save the file.

## Output Table for Input to the Induced Travel Module

1. Create a new worksheet. From the exhaust worksheet, right click and select Insert. Name the worksheet "Induced Travel Module."
2. Copy and Paste Special Values the VTGCMY2 subtable to the induced travel worksheet just created. Click on the exhaust worksheet. Select subtable VTGCMY2 Columns [VTGCMY2] through [VTMY] (the complete subtable) and copy. Click on the Induced Travel Module worksheet and Paste Special Values.
3. Create a temporary column to remove off-road emissions. In row 2 of the first column to the right of [VMT] type the following formula:
=if(left(right([VTGCMY2]2,6),1)="0",0,1)
4. Populated the temporary column. Copy it and Paste Special Values to remove the formulas.
5. Sort the entire table by the temporary column.
6. Delete off-road records. Select the temporary column and find the first nonduplicate record (=1). Select the last row with a zero value in the temporary column. Delete all records with zeroes in the temporary column.
7. Save the file.
8. Aggregate evaporative and exhaust emissions for the [NMHC], [NMOG], and [TotalHC]. Type the following formula into the cell in Row 2 of the [NMHC] Column of the Induced Travel Module table:
=vlookup([Induced Travel Module.\$VTMY]2,[Evaporative Worksheet.\$VTMY]\$2:
\$[TotalHC]\$/ast, columns([Evaporative Worksheet.\$VTMY]2:[NMHC]2),false) * \$[Induced Travel Module.\$Energy_Prop]2+vlookup([Induced Travel Module.\$VTGCMY2]2,[Exhaust Worksheet.\$VTGCMY2]\$2: \$[TotalHC]\$last, columns([Exhaust Worksheet.\$ VTGCMY2]2:[NMHC]2),false)

Populate the rest of the column. Copy the column and Paste (NOT Paste Special) into [Induced Travel Module.NMOG]2, and [Induced Travel Module.TotalHC]2. This will populate those columns as well.
9. Create a new ID variable to aggregate by GASCAP functional classifications. Type "GC" into the cell in Row 1 of the column immediately to the right of [VTMY]. Type the following formula in Row 2 of that column:
=if(left(right([VTGCMY2]2, 6),1)="1","Interstates", if(left(right([VTGCMY2]2,
6),1)="2","Arterials", if(left(right([VTGCMY2]2, 6),1)="3","Collectors","Local")))

Populate the rest of the column with this formula.
10. Aggregate the table to GASCAP functional classifications. Copy the labels in Row 1 in the Induced Travel Module to a cell two columns to the right of the last column in the table. Replace the first ID variable (VTGCMY2) with GC5 in the cell in Row 1 in the column. In Rows 2 through 5 of Column [GC5.GC5] type "Interstates", "Arterials", "Collectors", and "Local"
11. In Row 2 of [GC5.CO2] calculate aggregated $\mathrm{CO}_{2}$ emissions per VMT by entering the following formula:
= sumif(\$[VTGCMY2.GC]\$2: \$[VTGCMY2.GC]\$last, \$[GC5.GC5]2, [ VTGCMY2.CO2]\$2: [VTGCMY2.CO2]\$/ast) / sumif(\$[VTGCMY2.GC]\$2: \$[VTGCMY2.GC]\$/ast, \$[GC5.GC5]2, \$[VTGCMY2.VMT]\$2:
\$[VTGCMY2.VMT]\$last)
Select the cells in Rows 2 through 5 in Column [GC5.CO2] and press Control-D. Hold down the Shift key and use the Right Arrow to select Columns [GC5.CO2] through [GC5.TotalHC] and press Control-R. Copy and Paste Special Values (Alt, $\mathrm{E}, \mathrm{S}, \mathrm{V}$ ) to remove the formulas.
12. Clear (Delete key) the [GC5.VMT] labels and all of the labels to the right of that. Select and delete (Right click, choose Delete from the popup menu) all of the columns to the left of [GC5.GC5].

This completes the updating of per VMT Direct Emissions Factors.

## Conversion to Vehicle Types Used in GASCAP

1. Copied and pasted emissions factors from Transport Table into new book by selecting columns Q ('VTMYperVMT') through AD ("TotalHC') pressing Ctrl + c to copy the cells, then inserting a new worksheet and pressing Ctrl $+v$ to paste the cells into this worksheet.
2. Calculated the year for each row by titling a column 'Year' then using the formula $=\mathrm{VALUE}(\operatorname{RIGHT}(\mathrm{A} 2,4)$ ) (where A is the 'VMTYperVMT' column). This formula takes the first four digits from the VMTYperVMT column (which represents the year). Once the formula has been entered in a cell it can be filled to the rest of the column (as above)
3. Calculate the relevant part of the SCC code (first seven digits) to assign SCC codes to vehicle types.
4. Use the lookup table (Table 3) to convert SCC codes to vehicle types

Table 3 - Lookup table to convert SCC codes to vehicle types

| Applicable Portion of SCC <br> Code | Description |
| :--- | :--- |
| 2201001 | Light-duty gasoline vehicles (passenger cars) |
| 2201020 | Light-duty gasoline trucks 1 (0-6,000 lb gross vehicle weight rating [GVWR]) |
| 2201040 | Light-duty gasoline trucks 2 (6,001-8,500 lb GVWR) |
| 2201070 | Heavy-duty gasoline vehicles (> 8,500 lb GVWR) |
| 2201080 | Motorcycles (gasoline) |
| 2230001 | Light-duty diesel vehicles (passenger cars) |
| 2230060 | Light-duty diesel trucks (0-8,500 lb GVWR) |
| 2230071 | Class 2b heavy-duty diesel vehicles (8,501-10,000 lb GVWR) |
| 2230072 | Class 3, 4, and 5 heavy-duty diesel vehicles (10,001-19,500 lb GVWR) |
| 2230073 | Class 6 and 7 heavy-duty diesel vehicles (19,501-33,000 lb GVWR) |
| 2230074 | Class 8 heavy-duty diesel vehicles (> 33,000 lb GVWR) |
| 2230075 | Diesel buses |

Source: Technical Guidance on the Use of MOVES2010 for Emission Inventory Preparation in State Implementation Plans and Transportation Conformity, Table A1 (http://www.epa.gov/otaq/models/moves/420b10023.pdf)
6. Created single list with one row for each year, vehicle, and fuel type summing the emissions factors.
7. Deleted motorcycle, motor homes and intercity buses (not used in GASCAP)
8. Added rows for BD20 (one row for each year/ vehicle type combination). For BD20 Direct Emissions same as for diesel fuel
9. Calculated Upstream emissions factors in g/mmBTU from total energy consumption (MMBTU/mile) and miles per gallon from MOVES.

## APPENDIX B: <br> UPDATING VEHICLE AND FUEL-CYCLE EMISSIONS FACTORS FROM THE GREET MODELS

This section outlines the process to extract values from the latest versions of the GREET Fuel and Vehicle Cycle Models for input into GASCAP. There are four principal groups of values which need to be input into GASCAP:

- Process Fuels
- Electricity Production
- Steel
- Other Materials.

Throughout this report, worksheet tab names are given in SMALL CAPS and table names within these tabs are given in italics.

## Downloading GREET

The two GREET models (Vehicle Cycle and Fuel Cycle) can be downloaded from the Argonne National Laboratory website: http://greet.es.anl.gov/ (It may be necessary to create an account in order to do this). The most recent versions of the models (as of March 2012) are:

- GREET Fuel Cycle Model: GREET1_2011
- GREET Vehicle Cycle Model: GREET 2.7

## GREET Fuel Cycle Model

It is not necessary to actually install the model; rather, there is a link on the website that lets you download the spreadsheets only (under section 3 of the step by step instructions ('To Download GREET') part a
http://greet.es.anl.gov/files/greet 12011 mac ). This downloads a zip file, from which the required GREET Fuel Cycle Model spreadsheet (GREET1_2011.xls) can be extracted and saved in a location of the user's choice.

## GREET Vehicle Cycle Model

Similarly, the GREET Vehicle Cycle Model is downloaded as a zip file from the website (http://greet.es.anl.gov/files/greet27). This contains the required GREET Vehicle Cycle

Model (GREET2_7.xls) which can be extracted and saved in a location of the user's choice.

Note that for both of these spreadsheets the default inputs are used (i.e. no changes to these spreadsheets are required) unless specified otherwise.

## Process Fuels

Table 5 gives the GHG Emissions of Process Fuels in g/MMBtu. These were extracted from the sources specified in the following sections.

Table 5-GHG emissions of process fuels in g/MMBtu

| Upstream Emissions of Process Fuels (g/MMBtu) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

See subsequent sections for asphalt and steel production. |  |  |  |  |  |  |  |  |  |

## Upstream Emissions of Process Fuels

Upstream emissions of Coal were extracted from the CoAL worksheet in the GREET Fuel Cycle Model, table 3) Summary of Energy Consumption and Emissions: Btu or Grams per mmBtu of Fuel Throughput at Each Stage for $\mathrm{CO}_{2}, \mathrm{CH}_{4}$ and $\mathrm{N}_{2} \mathrm{O}$. In GREET1_2011 this table is given in cells A60 to G78, and the values for $\mathrm{CO}_{2}, \mathrm{CH}_{4}$ and $\mathrm{N}_{2} \mathrm{O}$ are given in cells $\mathrm{B} 74, \mathrm{~B} 75$ and B 77 respectively.

Upstream emissions of Natural Gas, Conventional Gasoline, Distillate Fuel Oil and Liquid Petroleum Gasoline (LPG) were extracted from the Results tab in the GREET Fuel Cycle Model, table 1. Well-to-Pump Energy Consumption and Emissions. This table presents results as energy in Btu and emissions in grams of $\mathrm{CO}_{2}, \mathrm{CH}_{4}$ and $\mathrm{N}_{2} \mathrm{O}$ per MMBtu of fuel. In GREET1_2011 this table is given in cells A1 to AR25, and the values are given in cells G10-G12, B10 - B12, E10 - E12 and H10 - H12 respectively.

## Asphalt

For asphalt, crude upstream emissions are taken from the Petroleum worksheet in the GREET Fuel Cycle Model, table 5) Summary of Energy Consumption and Emissions: Btu or Grams per mmBtu of Fuel Throughput at Each Stage. In GREET1_2011 this table is given in cells A189 to N207, and the values are given in cells B203, B204 and B206 respectively.

Refinery emissions are based on the relative Product Efficiency (Energy-content based) of Residual Oil and Asphalt:

Table 6 - Product efficiency of residual oil and asphalt

|  | Product Efficiency (Energy-content based) |
| :--- | :---: |
| Residual Oil | 94.2 |
| Asphalt | 85.1 |
| Source: ${ }^{(3)}$ |  |

Refinery emissions for Residual Oil are taken from the Petroleum worksheet in the GREET Fuel Cycle Model, table 5) Summary of Energy Consumption and Emissions: Btu or Grams per mmBtu of Fuel Throughput at Each Stage, column Resi. Oil for $\mathrm{CO}_{2}$, $\mathrm{CH}_{4}$ and $\mathrm{N}_{2} \mathrm{O}$. In GREET1_2011 this table is given in cells A189 to N 207 , and the values are given in cells J203, J204 and J 206 respectively.

Refinery emissions for Asphalt are calculated as:

$$
\frac{100-\text { Product Efficiency (Asphalt) }}{100-\text { Product Efficiency (Residual Oil) }} * \text { Refinery Emissions (Residual Oil) }
$$

Upstream and refinery emissions are then summed for input into GASCAP.

## Coke

Upstream emissions for coke are calculated in two steps: one for the coking process and the other for the emissions for the coal input.

## Step 1: Coking Process

The coking process itself has two stages, upstream emissions of the fuels used and emissions from the burning of fuels and heating of coal:

1. Upstream emissions of fuels (coal, natural gas, residual oil), for which the quantity of fuels used for coke production is obtained from the GREET Vehicle Cycle Model, Steel worksheet, table 4.1) Energy Use and Emissions Related to Virgin Steel Production, section 'Energy Use: mmBtu per ton of intermediate material product and final steel product', column 'Coke Production'. In GREET2_7 this table is given in cells A61 to K88, and the values are given in cells D67 - D69. The emissions factors for these fuels are obtained from the GREET Fuel Cycle Model (as in Table 5). Here, the petroleum component is assumed to be entirely residual oil. Hence the Upstream Emissions factors used are:

Table 7 - Upstream emissions of the fuels used in the coking process

|  | Natural |  |  |
| :--- | ---: | ---: | ---: |
| Residual <br> Oil |  |  |  |
| $\mathrm{CO}_{2}$ | 1,664 | 12,865 | 7,326 |
| $\mathrm{CH}_{4}$ | 148.3 | 551.1 | 37.23 |
| $\mathrm{~N}_{2} \mathrm{O}$ | 0.0308 | 0.2709 | 0.1179 |

These factors are then multiplied by the quantity of fuels used for coke production to give total upstream emissions.
2. Burning of fuels and heating of coal is taken from GREET Vehicle Cycle Model, Steel worksheet, table 4.1) Energy Use and Emissions Related to Virgin Steel Production, section 'Total Emissions: grams per ton of intermediate material product and final steel product’, column 'Coke Production'. In GREET2_7 this table is given in cells A61 to K88, and the values are given in cells D80 and D77 -78 .

Total emissions for the coking process are the sum of these values. This is summarized in Table 8.

Table 8 - Sources for GREET emissions factors

|  | Model | Worksheet | Table | Cell Range |
| :--- | :--- | :--- | :--- | :--- |
| Quantity of <br> Fuels Used for <br> Coke <br> Production | GREET Vehicle <br> Cycle Model <br> (GREET2_7) | Steel | 4.1) Energy Use and <br> Emissions Related to <br> Virgin Steel <br> Production | D67 - D69 |
| Upstream <br> Emissions <br> Factors (Coal) | GREET Fuel <br> Cycle Model <br> (GREET1_2011) | Coal | 3) Summary of Energy <br> Consumption and <br> Emissions: Btu or <br> Grams per mmBtu of <br> Fuel Throughput at <br> Each Stage | B74-5, B77 |
| Upstream <br> Emissions <br> Factors (Natural <br> Gas) | GREET Fuel <br> Cycle Model <br> (GREET1_2011) | Results | 1. Well-to-Pump <br> Energy Consumption <br> and Emissions. | G10-12 |
| Burning of Fuels <br> and Heating of <br> Coal Emissions <br> Factors | GREET Vehicle <br> Cycle Model <br> (GREET2_7) | Steel | 4.1) Energy Use and <br> Emissions Related to <br> Virgin Steel <br> Production | D80, D77-8 |

Step 2: Emissions for the Coal Inputs
Upstream emissions for the coal inputs are taken from the GREET Fuel Model, CoAL worksheet, table 3) Summary of Energy Consumption and Emissions: Btu or Grams per mmBtu of Fuel Throughput at Each Stage, column 'Coal to Coking Plants'. In GREET1_2011 this table is given in cells A60 to G78, and the values are given in cells F77, F74 and F75.

To convert these numbers into g/ton of coke, we use a coal-to-coke conversion ratio obtained from Joseck, Wang and Wu (2008). The heat content of coke obtained from the Energy Information Administration (EIA) is used to convert the upstream emissions for coal inputs into g/ton of coke (Table 9).

Table 9 - Coke upstream emissions: conversion factors

| LHV of Coal <br> Coke to Coal Conversion Ratio <br> (Tons of Coke/ Tons of Coal) | Conversion <br> Factor |  |
| :--- | ---: | :--- |
|  | Source |  |
|  |  | 0.72 |

Upstream emissions for coal inputs ( $\mathrm{g} / \mathrm{mmBTU}$ of coal) are multiplied by the Lower Heating Value (LHV) for coal $(25,000)$ to convert these into emissions in g/ton of coal. This value is then multiplied by the coke to coal conversion ratio ( 0.72 ) to convert these into $\mathrm{g} / \mathrm{ton}$ of coke.

Emissions from the coking process (in g/ton of steel) (step 1 above) are divided by the number of tons of coke needed per ton of steel (0.531) to convert these into g/ton of coke. This value is obtained from the GREET Vehicle Cycle Model, Steel worksheet table 4.1) Energy Use and Emissions Related to Virgin Steel Production, row 'Tons of intermediate material needed per ton of steel' column 'Coke Production'. In GREET2_7, this table is given in table A61 to K88, and the value in cell D63.

Final upstream emissions (grams per ton of coke) are then the sum of emissions from the coking process (step 1 above) plus emissions for coal inputs (step 2 above). To convert these to grams per mmBTU these values are divided by 24,800 , the LHV of coke. ${ }^{(2)}$

## Petroleum Coke

Upstream emissions of petroleum coke consist of two parts: feedstocks and fuels. Emissions for feedstocks were taken from the GREET Fuel Cycle model, Petroleum worksheet, table 5.1) Energy Use and Total Emissions column 'Feedstocks, Crude for use in U.S. Refineries'. In GREET1_2011, this table is given in cells A188 to N215, and the values in cells B206, B203 and B204. Emissions for fuels were taken from the same table, GREET Fuel Cycle model, Petroleum worksheet, table 5.1) Energy Use and Total Emissions column 'Fuels, Pet Coke'. In GREET1_2011, this table is given in cells A188 to N215, and the values in cells N206, N203 and N204. These values are then summed to give the Upstream Emissions for Petroleum Coke.

Combustion emissions of process fuels are taken from the GREET Fuel Cycle Model, worksheet EF (Emissions Factors), table 1) Emission Factors of Fuel Combustion for Stationary Applications (grams per mmBtu of fuel burned). In GREET1_2011 this table is given in cells A3 to AY14, and the values are given in cells B12 - 14, J12 - 14, L12 14, Q12-14, T12-14, X12 - 14 and AV12 - 14 respectively. The Upstream and Combustion Emissions are then summed to give combined emissions.

## Electricity

## Mix of Energy Sources

Energy sources for Electricity Production are taken from the GREET Fuel Cycle Model, InPUTS worksheet table 9.2.b) Electric Generation Mixes: Data Table for Use in GREET (From Annual Energy Outlook 2010), U.S. Mix for Transportation and N.E. U.S. Mix for transportation respectively (see Table 10). In GREET1_2011 this table is given in cells

A407 to J415, and the values are given in cells C410 to C415 and E410 to E415 respectively.

Table 10 - Mix of energy sources for electricity production in the United States and the Northeast US

| Residual Oil | United States |  |
| :--- | :---: | :---: |
|  | $1.00 \%$ | Northeast US |
|  | $22.87 \%$ | $2.08 \%$ |
| Nuclear Power | $46.45 \%$ | $49.66 \%$ |
| Biomass | $20.26 \%$ | $7.96 \%$ |
| Other Sources* | $0.23 \%$ | $31.24 \%$ |
| * hydro electric, wind, and geothermal energy are offered as examples. |  |  |
| Source: ${ }^{(1)}$ |  |  |

## Transmission Loss

Transmission Loss is an input in the GREET Fuel Cycle Model which users can change for their own simulations. It is stored in the ElECTRIC worksheet, table 3) Electric Transmission and Distribution Loss. In GREET1_2011 this is cell D46. The default value is used in GASCAP; currently (GREET 1_2011) this is set to be 8\%.

## GHG Emission Factors

The GHG Emission Factors for Energy Production in g/MMBtu are taken from the GREET Fuel Cycle Model, Electric worksheet, table 9) Fuel-Cycle Energy Use and Emissions of Electric Generation: Btu or Grams per mmBtu of Electricity Available at User Sites (wall outlets). In GREET1_2011 this table is given in cells A134 to DM153, and the values are taken from cells G143, G144 and G149 - G152 (see Table 11).

Note that to change between United States and Northeast US energy mixes the relevant values in the GREET Fuel Cycle Model, Inputs worksheet, table 9.2.a) Selection of Electricity Generation Mix for Transportation Use of the GREET Fuel Cycle Model must be selected. In GREET1_2011 this table is given in cells A402 to H405. To use the U.S. Mix, cells C403 and C404 have to be set to value ' 1 '; to use the Northeast US Mix, these cells have to be set to value ' 2 '.

Table 11 - GHG emission factors for electricity production in the United States and the Northeast US

|  | United States g/MMBtu | Northeast US g/MMBtu |
| :---: | :---: | :---: |
| VOC | 3.567 | 4.931 |
| CO | 44.78 | 42.43 |
| $\mathrm{CH}_{4}$ | 4.023 | 5.290 |
| $\mathrm{N}_{2} \mathrm{O}$ | 2.539 | 2.689 |
| $\mathrm{CO}_{2}$ | 200,133 | 112,882 |
| $\mathrm{CO}_{2}$ (incl. VOC, CO) | 200,214 | 112,964 |
| Source: ${ }^{(1)}$ |  |  |

## Steel

## Virgin Steel

Emissions factors for virgin steel are calculated from the Steel worksheet, Table 4.1) Energy Use and Emissions Related to Virgin Steel Production (see Table 12). In GREET2_7 this table is given in cells A61 to K88. The product of 'Tons of intermediate material needed per ton of steel' and respective emissions in grams per ton of intermediate material product and final steel product is calculated for each stage in the production of steel. In GREET2_7, 'Tons of intermediate material needed per ton of steel' is given in cells A63 - I63, and emissions are given in cells B80 - I80, B77 - I77 and B78-178. For rolled steel the overall emissions factors are the sum of the first seven stages (Ore Recovery to Sheet Production and Rolling). For stamped steel, the emissions factors are the sum of all eight stages. Within GASCAP it is only necessary to update the emissions factors for steps $1-8$ (see below); the calculation of emissions factors for Cast Steel, Rolled Steel and Stamped Steel and the conversion of the factors from $\mathrm{g} / \mathrm{ton}$ to $\mathrm{g} / \mathrm{lb}$ are carried out automatically within GASCAP.

Table 12 - Virgin steel emissions factors

| $\begin{aligned} & \mathrm{CO}_{2}(\mathrm{VOC}, \\ & \left.\mathrm{CO}, \mathrm{CO}_{2}\right) \\ & \mathrm{CH}_{4} \\ & \mathrm{~N}_{2} \mathrm{O} \\ & \hline \end{aligned}$ | 1 <br> Ore Recovery | 2 <br> Ore Pelletizing \& Sintering | 3 <br> Coke <br> Production | 4 <br> Blast Furnace | 5 <br> Basic $\mathrm{O}_{2}$ <br> Processing | $\qquad$ | Sheet Production \& Rolling | 8 <br> Stamping |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 25,957.46 | 276,672.90 | 148,068.65 | 1,363,164.97 | 1,570,965.56 | 85,315.20 | 718,636.70 | 522,459.99 |
|  | 29.47 | 551.49 | 390.45 | 686.36 | 396.08 | 217.77 | 1,730.67 | 1,179.46 |
|  | 0.63 | 3.80 | 3.05 | 0.62 | 1.01 | 1.14 | 11.78 | 8.33 |
| $\begin{aligned} & \mathrm{CO}_{2}(\mathrm{VOC}, \\ & \left.\mathrm{CO}, \mathrm{CO}_{2}\right) \\ & \mathrm{CH}_{4} \\ & \mathrm{~N}_{2} \mathrm{O} \\ & \hline \end{aligned}$ | Sum of 1-6 <br> Cast Steel <br> g/ton steel | Sum of 1-7 <br> Rolled Steel <br> g/ton steel | Sum of 1-8 <br> Stamped Steel <br> g/ton steel |  |  | Sum of 1-6 <br> Cast Steel <br> g/lb steel | Sum of 1-7 <br> Rolled Steel <br> g/lb steel | Sum of 1-8 <br> Stamped Steel g/lb steel |
|  | 3,470,145 | 4,188,781 | 4,711,241 |  |  | 1,735 | 2,094 | 2,356 |
|  | 2,271.62 | 4,002.29 | 5,181.75 |  |  | 1.14 | 2.00 | 2.59 |
|  | 10.25 | 22.03 | 30.36 |  |  | 0.01 | 0.01 | 0.02 |
| Source: GREET Vehicle Cycle Model 2.7 |  |  |  |  |  |  |  |  |

## Recycled Steel

Emission factors for recycled steel were calculated in the same way as for virgin steel, except the values used were taken from the GREET Vehicle Cycle Model, Steel worksheet Table 4.2) Energy Use and Emissions Related to Recycled Steel Production (see Table 13). In GREET2_7 this table is given in cells A90 to G117. 'Tons of intermediate material needed per ton of steel' is given in cells A92-E92, and emissions are given in cells B109 - E109, B106 - E106 and B107 - E107. In this case, rolled steel is the first 3 stages (Basic $\mathrm{O}_{2}$ Processing to Sheet Production and Rolling) and stamped steel is all 4 stages. Again, it is only necessary to update the emissions factors for steps 1 - 4; the calculation of emissions factors for Cast Steel, Rolled Steel and Stamped Steel and the conversion of the factors from g/ton to g/lb are carried out automatically within GASCAP.

Table 13 - Recycled steel emissions factors

| $\mathrm{CO}_{2}\left(\mathrm{VOC}, \mathrm{CO}, \mathrm{CO}_{2}\right)$ | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: |
|  | Basic $\mathrm{O}_{2}$ <br> Processing | Electric Arc <br> Furnace | Sheet Production \& Rolling | Stamping |
|  | 99,568.24 | 593,328.43 | 718,636.70 | 522,459.99 |
| $\mathrm{CH}_{4}$ | 25.10 | 1,514.50 | 1,730.67 | 1,179.46 |
| $\mathrm{N}_{2} \mathrm{O}$ | 0.06 | 7.94 | 11.78 | 8.33 |
| $\mathrm{CO}_{2}$ (VOC, $\mathrm{CO}, \mathrm{CO}_{2}$ ) | Sum of 1-3 | Sum of 1-4 | Sum of 1-3 | Sum of 1-4 |
|  | Rolled g/ton | Stamped <br> g/ton | Rolled g/lb | Stamped g/lb |
|  | 1,411,533.37 | 1,933,993.36 | 705.77 | 967.00 |
| $\mathrm{CH}_{4}$ | 3,270.27 | 4,449.72 | 1.64 | 2.22 |
| $\mathrm{N}_{2} \mathrm{O}$ | 19.78 | 28.11 | 0.01 | 0.01 |
| Source: ${ }^{(2)}$ |  |  |  |  |

Total steel emissions are then based on the virgin/ recycled mix: 62\% recycled steel and $38 \%$ virgin steel ${ }^{(5)}$.

## Other Materials

Emissions factors for plastics, rubber, zinc, virgin and recycled aluminum, glass, lubricating oil and copper are taken directly from GREET Vehicle Cycle Model ${ }^{(2)}$. These are shown in Table 14 and Table 15.

Table 14 - Plastics emissions factors

|  | Final Polypropylene <br> Product: Combined | Final Average <br> Plastic Product: <br> Combined | Final Glass Fiber- <br> Reinforced Plastic <br> Product: Combined | Final Carbon Fiber- <br> Reinforced Plastic <br> Product: Combined |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathrm{g} /$ ton | $\mathrm{g} /$ ton | $\mathrm{g} /$ ton |  |

Table 15 - Other materials emissions factors

|  | Rubber <br> $\mathrm{g} /$ ton | Zinc <br> $\mathrm{g} /$ ton | Virgin Aluminum $\mathrm{g} /$ ton | Recycled Aluminum $\mathrm{g} /$ ton | Glass <br> $\mathrm{g} /$ ton | Lubricating Oil $\mathrm{g} /$ ton | Copper <br> $\mathrm{g} /$ ton |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{CO}_{2}$ | 2,759,383 | 7,637,808 | 10,582,916 | 2,796,398 | 1,241,784 | 3,929,319 | 7,358,381 |
| $\mathrm{CH}_{4}$ | 5,122.61 | 13,894.11 | 16,319.14 | 6,483.46 | 6,600.77 | 4,039.78 | 12,162.94 |
| $\mathrm{N}_{2} \mathrm{O}$ | 29.82 | 84.46 | 126.26 | 44.86 | 18.79 | 24.04 | 88.32 |

Sources for these emissions factors are listed in Table 16.

Table 16-GREET2_7 sources for emissions factors for other materials

| Final Polypropylene Product: Combined | Worksheet | Table | GREET2_7 Cell Range |
| :---: | :---: | :---: | :---: |
|  | Plastic | 4) Summary of Energy Consumption and Emissions Related to Plastic Production | $\begin{aligned} & \text { J81 - K81, J78 - } \\ & \text { K78, J79 - K79 } \end{aligned}$ |
| Final Average Plastic Product: Combined | Plastic | 4) Summary of Energy Consumption and Emissions Related to Plastic Production | $\begin{aligned} & \text { L81 - M81, L78 - } \\ & \text { M78, L79 - M79 } \end{aligned}$ |
| Final Glass FiberReinforced Plastic Product: Combined Final Carbon FiberReinforced Plastic Product: Combined Rubber | Plastic | 4) Summary of Energy Consumption and Emissions Related to Plastic Production | $\begin{aligned} & \hline \text { N81 - O81, N78 - } \\ & \text { O78, N79 - O79 } \end{aligned}$ |
|  | Plastic | 4) Summary of Energy Consumption and Emissions Related to Plastic Production | $\begin{aligned} & \text { P81 - Q81, P78 - } \\ & \text { Q78, P79 - Q79 } \end{aligned}$ |
|  | Rubber | 3) Summary of Energy Consumption and Emissions Related to Rubber Production | $\begin{aligned} & \hline \text { B66 - C66, B63 - } \\ & \text { C63, B64 - C64 } \end{aligned}$ |
| Zinc | Zinc | 3) Summary of Energy Consumption and Emissions Related to Zinc Production | $\begin{aligned} & \text { B66 - C66, B63 - } \\ & \text { C63, B64 - C64 } \end{aligned}$ |
| Virgin Aluminum | W.AI | 4.1) Energy Use and Emissions Related to Virgin Wrought Aluminum Production | $\begin{aligned} & \text { H102 - I102, H99 } \\ & -\mathrm{I} 99, \mathrm{H} 100-\mathrm{I} 100 \end{aligned}$ |
| Recycled Aluminum | W.AI | 4.2) Energy Use and Emissions Related to Recycled Wrought Aluminum Production | $\begin{aligned} & \text { G131 - H131, } \\ & \text { G128 - H128, } \\ & \text { G129 - H129 } \end{aligned}$ |
| Glass | Glass | 4) Summary of Energy Consumption and Emissions Related to Glass Production | D70, D67, D68 |
| Lubricating Oil | Vehi_Fluids | 4) Summary of Energy Consumption and Emissions Related to Fluids Production and Disposal | $\begin{aligned} & \text { Sum(D51, E51), } \\ & \text { sum(D49, E49), } \\ & \text { sum (D50, E50) } \end{aligned}$ |
| Copper | Copper | 3) Summary of Energy Consumption and Emissions Related to Copper Production | D66, D63, D64 |

Note: For Lubricating Oil, the emission factor is the sum of production and disposal for engine oil. Total emissions for aluminum are based on the virgin/ recycled mix: $62 \%$ recycled aluminum and $38 \%$ virgin aluminum.

## Updating GASCAP

Within GASCAP the orange tabs are used to update the values extracted from GREET. Note that the administrator password is required to update these values (see User Guide). This is entered in the 'Project Info' tab in GASCAP. This password only needs entering once per session. The project manager should be contacted if you do not have access to the password.

## Process Fuels

In order to update the Upstream Emissions of Process Fuels, select the orange Process Fuels tab in GASCAP then click on the Update Process Fuels Upstream Emissions button. This will display a form where the values extracted from GREET can be entered (the first section in Table 5). Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

In order to update the Combustion of Process fuels, select the orange Process Fuels tab in GASCAP then click on the Update Process Fuels Combustion Emissions button. This will display a form where the values extracted from GREET can be entered (the second section in Table 5). Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

## Electricity Production

In order to update the Energy Sources for Electricity, select the orange Electricity Production tab in GASCAP then click on the Update Energy Sources for Electricity button. This will display a form where the values extracted from GREET can be entered (Table 10 above). The Region button near the foot of the form allows the region to be switched between the United States Average and the North East. Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP. Note that it is necessary to Update Factors separately for US and NE (clicking the Update Factors button will only update the factors for the region currently selected).

In order to update the Transmission Loss, select the orange Electricity Production tab in GASCAP then click on the Update Transmission Loss button. This will display a form where the transmission loss can be entered. Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

In order to update the Energy Emissions for Electricity select the orange Electricity Production tab in GASCAP then click on the Update Energy Emissions for Electricity button. This will display a form where the Energy Emissions for Electricity can be entered. Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

## Steel

In order to update the Virgin Steel Emissions Factors select the orange Steel tab in GASCAP then click on the Update Virgin Steel Emissions Factors button. This will display a form where the Virgin Steel Emissions Factors can be updated. Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

In order to update the Recycled Steel Emissions Factors select the orange Steel tab in GASCAP then click on the Update Recycled Steel Emissions Factors button. This will display a form where the Recycled Steel Emissions Factors can be updated. Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

## Other Materials

In order to update the Plastics Emissions Factors select the orange Other Materials tab in GASCAP then click on the Update Plastics Emissions Factors button. This will display a form where the Plastic Emissions Factors can be updated. Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

In order to update the Other Materials Emissions Factors select the orange Other Materials tab in GASCAP then click on the Update Other Materials Emissions Factors button. This will display a form where the Other Materials Emissions Factors can be updated. Enter the updated values in each of the boxes, then click the Update Factors button to update the values within GASCAP.

## APPENDIX C: <br> UPDATING EQUIPMENT DATA

The National Mobile Inventory Model (NMIM) is a program that models direct greenhouse gas (GHG) engine emissions. This software is published and made available at no cost by the EPA Office of Transportation and Air Quality (OTAQ). This guidance was written based on the version of NMIM that was released May 4, 2009. NMIM has two components, MOBILE and NONROAD. MOBILE estimates emissions from vehicles while NONROAD estimates emissions from various types of equipment. MOBILE has been replaced by MOVES and is now obsolete. NMIM is used in this update procedure in order to provide access to the NONROAD component.

This guidance will walk the user through an update procedure for the equipment emission factors included in GASCAP. That procedure includes running the NONROAD component of NMIM using a script that specifies equipment type, power rating in horsepower (HP), year, and usage for equipment types covered in GASCAP. The script specifies 1 hour of running time for one piece of equipment averaged equally across twelve months for each type of equipment, broken down by power rating in HP and fuel type. The script is available in electronic form on the GASCAP CD and is included as an appendix to this guidance. Once run the results are exported as tab-delimited ASCII files. A MySQL script is then used to prepare this data for GASCAP. This outputs a comma-delimited (csv) file, which can be copied and pasted into the appropriate place in GASCAP to update the equipment emission factors.

## NMIM / NONROAD Software Installation

This guidance does not cover software installation in depth because that procedure is thoroughly documented on the NMIM website at

## http://www.epa.gov/otaq/nmim.htm

Users are strongly advised to read the general information, user documents and tools, and downloading instructions carefully. We urgently suggest that you follow the installation instructions to the letter. It will save considerable frustration. The installation has three components. First a Java platform is installed, followed by an SQL program named MySQL, and finally the NMIM program itself. Care must be taken to install the proper version of each component as recommended because the NMIM will not run otherwise. Please refer any problems you have with the NMIM installation to OTAQ. Unfortunately NMIM and MOVES use different Java and MySQL versions. We were told by OTAQ that it should be possible to load both programs on a single computer. However we were unable to do so in any stable configuration.

## Running NONROAD

Access NONROAD by clicking first the NMIM Worker icon and then the NMIM Master icon. Click OK in the AboutNMIM popup. In order to extract data to calculate methane
emissions $\left(\mathrm{CH}_{4}\right)$ it is necessary to model total organic gases (TOG) and non-methane organic gases (NMOG) and calculate the difference. For NMIM that requires two separate runs.

## First Run

The NMIM program receives specifications on the left side. The menu items include:

- Description (Optional)
- Geography
- Time
- Vehicles/Equipment (Expandable)
- Fleet (Expandable) (Optional)
- Pollutants
- Advanced Features (Optional)
- Diesel Retrofit (Expandable) (Optional), and
- Output (Expandable)

NMIM indicates that specifications are workable with a green check mark to the left of each menu item. When NMIM is first started none of the menu items is checked. Mandatory items have violet exclamation marks and optional items have yellow wavy equal signs. Exclamation marks indicate that there is an error or lack of information that will prevent the program from running.

1. Select Geography. Click on the Geography menu item. Under the Region heading click the County radial button if it is not active. Under the States heading click New Jersey. Under the Counties click New Jersey - Middlesex County. Click the Add box. A green check mark should appear to the left of the Geography menu item.
2. Access the script (a copy is saved in NMIM Script). Select the Fleet menu. Select the Nonroad sub menu. Check the Perform Nonroad Fleet Modeling check box. Click the Browse box and navigate to the script file (NMIM script.csv, unless
altered). Click the Open box. Under Diagnostics click the Check Fleet Information File Now box.
3. Select Time. What you enter here will be overridden by the script but NMIM requires that valid input specifications be entered for this menu option. Select all months by clicking the check boxes. Select a year from the Year pulldown menu and click the Add box. A green check mark should appear to the left of the Time menu item.
4. Select Equipment. Again, specifications entered here will be overridden by the script. However, in this case NMIM will gray out the subject matter of this menu item. If it has not yet and a check mark has not yet appeared, click on Vehicles/Equipment menu item to bring up the Onroad and Nonroad sub menu items. Click on the Nonroad sub menu item. Select all fuel types under the Fuels header and construction under the Segments header. Click the Add Fuel/Segment Combinations box. A green mark should appear to the left of the Nonroad sub menu item and the Vehicles/Equipment menu item.
5. Select Pollutants. Select the Pollutants menu item. For the first run check the following boxes:

- Exhaust PM 10 microns
- Exhaust PM 2.5 microns
- CO
- $\mathrm{CO}_{2}$, and
- HC

Select NMOG from the drop down menu next to HC. A green check mark should appear next to the Pollutants menu. For the second run uncheck all items except HC and select TOG from the dropdown menu.
6. Set output parameters. Select the Output menu item. Select the Geographic Representation sub menu item. Click on the County radial button to activate it. A check mark should appear next to the Geographic Representation sub menu item. Click on the General Output sub menu item. If you are using your local drive leave the Server text box empty. Type a database name in the Database pulldown menu and click the Create Database box. A popup should appear that says "Output Database successfully created. Click OK in it. Uncheck the "Pre-
aggregate nonroad horsepower classes" check box. Check marks should have appeared next to the Output menu item and the General Output sub item.
7. Save your run specifications in the File menu.
8. Under the Action menu [across the top] select Execute. The specifications menu on the left will disappear and a progress bar will be produced.
9. When the run is completed run the error log. Copy the results and save in a text document. The error log will make it possible to identify the months (ERROR_MONTHS) that NONROAD assumes no activity for the particular piece of equipment (see Table 17).
10. Export Data. Under the Post Processing menu select Aggregate and Export. Choose the database and run from the drop down menus. Under Output Format click on the Wide Tables radial button to activate it. Check the Month aggregation check box. Click the Tab-delimited ASCII Text File radial button and type a file location and file name. The Browse button is useful for that purpose. Click OK or Save.

Table 17 - Example seasonal adjustment file

| SCC | ERROR_MONTHS | ADJ_FACTOR |
| :--- | :--- | :---: |
| 2270004036 | 9 | 0.25 |
| 2265004036 | 9 | 0.25 |
| 2260004036 | 9 | 0.25 |

## Second Run

11. Do the second run. Click on the Pollutants menu item. Uncheck all check boxes except HC. From the pull down menu next to HC choose TOG. Repeat steps 7, 8 [save as a different file], and 10. The error log does not have to be run because it should be identical to the previous run.

## Emissions Calculations

## Installing MySQL

A MySQL script has been written to automate the calculation of emissions from the NMIM output files. This script is detailed below. Note that it is necessary to have MySQL installed to run the script. This is installed as part of the installation of NMIM.

## Input Files

Before the MySQL script can be run it is necessary to prepare a number of input files the script uses. These are detailed below. Note that the NONROAD output files (Nonroad_nmog and Nonroad_tog) and the Seasonal Adjustment file (see Table 17) must be prepared each time NONROAD is run, whereas the other input files only need to be created once. With the exception of the NONROAD output files (which are saved as tab delimited files) all of the files should be saved as comma separated (csv) files. These can be created by:

1. Opening Microsoft Excel
2. Copying and pasting the data into a new workbook
3. Saving this as a csv file (File - Save As, then click the drop down arrow next to the 'Save as Type' and choose 'CSV (Comma delimited)'.

Once the CSV file has been created it is necessary to open it in notepad (by right clicking on the file and selecting 'Open With' then choosing 'Notepad'):

The header row of the file should be deleted, as well as any blank rows at the end of the file (Excel sometimes adds blank rows to the end of the file). Once this has been done, save the file, then copy it and put in the relevant MySQL data folder (C:IMySQLldataldatabase_name where database_name is the name of the database chosen for the MySQL run). Similarly, the output file will be saved in this location.

## Files to be Prepared Each Time NONROAD Runs

The following files are output by NONROAD and hence need to be updated each time it is run:

- Nonroad_nmog
- Nonroad_tog
- Seasonal Adjustment File.

## Seasonal Adjustment File

Some equipment types, such as snow blowers, are only used seasonally, and hence emissions from NONROAD underestimate such emissions. This can be corrected by looking at the error log NONROAD outputs. There should be two types of errors in the error log. The first is for equipment types at power ratings that were not used during the year in question. These will not be written to the databases and may be ignored. The
second type of error is for seasonal equipment types that have zero activity in a given month or months. Snow blowers are the only case of this that appears in the error log in 2011. To correct this, for each equipment type that appears in the error log adjust emissions for each equipment type $i$ and each pollutant $j$ using the following formula:

$$
\text { AdjEmissions }_{i j}=\frac{\text { NMIMEmissions }_{\mathrm{ij}}}{1-\left(\frac{\sum \text { Error_Months }_{\mathrm{i}}}{12}\right)}
$$

See Seasonal Adjustment file section for an example of the file that is required. Once created, this needs to be saved as a comma delimited (csv) file named seasonal_adj and saved in the database_name folder.

## Files To Be Created Once

The MySQL script uses four tables which need to be uploaded:

- Direct_n2o
- Fuel_consumption
- Upstream_ghg_factors
- Equipment_description

These tables are given in the Input Files section (below). In each case the data should be saved as a comma delimited (csv) file with the appropriate name (Direct_n2o.csv, Fuel_consumption.csv, etc.).

## Running the MySQL Script

Once MySQL has been installed, the MySQL query browser can be launched in the usual fashion (Start Menu - All Programs - MySQL - MySQL Query Browser). In the Server Host box enter localhost. Leave all other boxes as they are and click ok. An error message stating that 'No Default Schema Specified' may appear. This can be ignored (check the box next to 'Do not show this message any more' then select Ignore). The MySQL Query Browser interface appears. Select File - Open Script, then browse to the location where the script was saved and select open to display the script window.

## Database Names

The name of the database used is set at top of the script, where it says:
\# Set database name here:

Use database_name;

Execute the script by clicking on the execute button (the green toolbar button with the lightning symbol). The script carries out the following steps:

1. Uploads files output by NONROAD
2. Combines these two files into one table
3. Adjusts NONROAD output for seasonal equipment (such as snow blowers)
4. Calculates direct emissions from fossil fuels
a. Calculates direct emissions of $\mathrm{CO}_{2}$ : sum of $\mathrm{CO}_{2}$ measured by NONROAD, $\mathrm{CO}_{2}$ from NMOG and $\mathrm{CO}_{2}$ from the oxidation of CO
b. Calculates direct emissions of $\mathrm{CH}_{4}$ : Total Organic Gases - Non-Methane Organic Gases
c. Calculates direct emissions of $\mathrm{N}_{2} \mathrm{O}$ : upload table of direct emissions of $\mathrm{N}_{2} \mathrm{O}$ by SCC and power class
d. Calculates direct emissions of Black Carbon: multiply PM2.5 emissions by appropriate speciation factor, as specified in Table 18.

Table 18 - Black carbon speciation factors

| Third and fourth <br> digit of SCC | Equipment Type | Factor |
| :--- | :--- | :--- |
| $<66$ | Gasoline powered non-road equipment | 0.27 |
| 70 | Diesel-powered non-road equipment <br> Generic factor (applied to CNG and LPG <br> powered equipment) | 0.14 |
| Else |  |  |
| Source: ${ }^{(6)}$ |  |  |

5. Uploads fuel consumption table
6. Adds biofuels
7. Combines fossil fuels and biofuels into one table
8. Calculates upstream emissions
9. Calculates total emissions
10. Formats data for GASCAP

The script saves a comma delimited file called gascap_nonroad_final.csv in the database_name folder (C:IMySQLIdataldatabase_name).

## Updating GASCAP

Once the script has been run and the csv file produced GASCAP can be updated. Open the latest version of GASCAP and select the 'Equipment Year' worksheet. Enter the year for which the most recent data is available in the text box. As of May 2012 the 2011 data is included in the model. Then click on the update equipment button. This will create a new blank worksheet titled year Data (where year is the value entered in the textbox). Paste the formatted data as values into this blank worksheet including the headings. Then save and re-open GASCAP. This will automatically populate the selection boxes in the 'Equipment' worksheet to include the new data added.

## APPENDIX F: USER GUIDE

The following pages are the User Guide for GASCAP users. This is also available as a separate file on the CD's with the software.

Version 2.0

# User <br> Guide 

GASCAP was developed by the Alan M. Voorhees Transportation Center at Rutgers University under contract to the New Jersey Department of Transportation (NJDOT). This software is freely available to use for all purposes associated with estimating greenhouse gas emissions for transportation capital projects. Any modifications or updates made to GASCAP must also be for public use and the product and any modifications to. GASCAP may not be sold for commercial use.

## Introduction

GASCAP is a Microsoft Excel based spreadsheet tool designed for the New Jersey Department of Transportation to estimate greenhouse gas emissions associated with transportation capital projects. The current version includes sections to calculate emissions for the following:

Section 1: Materials - Estimates direct and upstream emissions for materials used in construction projects based on item codes from NJ DOT project bid sheets.

Section 2: Non-Road Equipment - Estimates direct and upstream emissions for non-road equipment used during construction activities.

Section 3: Recyclables - Estimates a credit against estimated emissions based on the use of various recycled materials in construction projects.

Section 4: Lifecycle Maintenance - Estimates direct and upstream emissions based on expected materials and equipment that will be used in maintaining the completed product over its lifespan.

Section 5a: Staging - Estimates direct and upstream emissions for on-road vehicles and temporary lighting used during construction of a project.

Section 5b: Traffic Disruption - Estimates direct and upstream emissions resulting from changes in vehicle miles of travel and vehicle efficiency due to work zones, lane closures, and detours.

Section 6: Lighting - Estimates direct emissions from the operation of permanent lighting fixtures over the lifespan of a project.

Section 7: Rail - Estimates direct and upstream emissions for various inputs that are specific to rail construction projects.

Section 8: Induced Travel - Estimates changes in mobile source emissions caused by changes in road capacity

Maintenance Department Module - Estimates emissions from routine, minor maintenance activities.

Section 9: Updating GASCAP - Procedures for updating background data on energy, vehicles, and materials used by GASCAP when estimating emissions.

## Enabling Macros

Most of the functionality of GASCAP is contained within macros，which are scripts that automate calculations and other program functionality．By default，macros are usually disabled in Excel．After opening the spreadsheet，a prompt will ask if the user wishes to enable macros or will present a security warning that some content is disabled．This prompt should be followed to enable macros．Macros must be enabled to load and run GASCAP．

## Project Info

The first worksheet displayed after enabling macros is the Project Info page．Basic information about the project（title，location，start and end dates，and description）should be entered here．The Reset button can also be used to reset the entire workbook and remove all items added in all sections．The project title displayed on other sheets is linked to the one entered on this page．

It is critical to program functionality that estimated project start and end dates are entered，even if they are very rough estimates．The dates are used to calculate project length（displayed on the Project Info page for reference） which is used in several emission calculation functions．

## Section 1: Materials

Material inputs to GASCAP are based on NJ DOT bid sheet item codes. The first step in entering a material is to input the 7-digit item code from the bid sheet. After inputting the item code, clicking 'Go' will display the appropriate unit of measurement for the item and pre-populate default variables for that item.

If you do not know an item's 7-digit code, you can click "Find Codes" to look up codes by item name. Then click "Ok" to send the code to Input Item Code box and click "Go."

The second step is to input the quantity of the item, which is located next to the item code on the bid sheet. Additionally, in step 3, default variables related to asphalt and concrete are displayed. These variables can be changed if desired. Variables that do not apply to the item selected will be greyed out. Clicking the Add Material button creates a new line item on the spreadsheet with emissions factors (in grams) for that item, and updates the total emissions for all materials. Individual line items can be removed by their respective buttons, or the entire sheet can be reset with the appropriate button. Total emissions can be vjewed in grams or metric tons.

## Section 2: Equipment

Section 2 is where all non-road equipment used during construction should be entered.
There are two methods for entering equipment as shown below. Click the button for the method you want to use.

## Method 1: Enter Equipment Activity Manually

Choose Method 1 if you know what pieces of non-road equipment will be used in the project and how long each piece of equipment will be operating.
Equipment is selected through a series of drop down boxes that must be selected in order.

## Method 2: Estimate Equipment Activity

Choose Method 2 if you do not know what pieces of equipment will be used or for what period of time. GASCAP will allow you to estimate the number of hours of equipment activity for 38 pieces of non-road equipment based on a sample of projects.

## Method 1 Enter Equipment Activity Manually

Step 1: Select the year the vehicle was manufactured
Step 2: Select the type of equipment
Step 3: Select the type of fuel used
Step 4: Select the vehicle's power rating
Step 5: Enter the number of hours the vehicle will be used in total during construction Step 6: The 'Add Equipment' button will add a line item on the spreadsheet with emissions factors
(in grams) for that item, and updates the total emissions for all equipment.
Before hitting the 'Add Equipment' button, the box labeled 'Air Conditioning?' should be checked if the equipment has it. Individual line items can be removed by their respective buttons, or the entire sheet can be reset with the appropriate button. Total emissions can be viewed in grams or metric tons.

## Method 2: Estimate Equipment Activity

Step 1: Enter the expected number of workdays in the textbox and click "OK." (Remember workdays do not include holidays or weekends on which no work will be performed).

Step 2: Select one of six project types from the dropdown menu. Choose which of the following best describes the current project:

1. Resurface Existing Highway
2. Construct Freeway / Extra Lane
3. Pavement Rehabilitation / Widening
4. Construct / Reconstruct Bridge
5. Construct Median, Thrie Beam Barrier
6. Landscaping

Then click "Estimate Phasing."

Step 3: The phasing describes what portion of the project work (in hours) is allocated to each phase - or general category of activity. To accept the default phasing, simply go to Step 4. To alter the default phasing, click the "Change Default Phasing" button to bring up the below menu. Enter new values for the percent of time devoted to each phase. To account for rounding errors, the total may range from $99.8 \%$ to $100.2 \%$.

Click the "Update Phasing Values" button to update the value.

Different mixes of equipment are used in each phase, so accurate phasing helps GASCAP to more closely approximate the specific project.
"Change Contract Orders" is an allowance for extra construction time due to changes in the contract. "Other" accounts for time that is spent performing uncategorized activities.

Step 4: Click the "OK" Button on the main screen to populate a default list of equipment activity and emissions.

Step 5: If you need to change the default hours of activity, model year, fuel type, or power of equipment, click the "Change" button next to the piece of equipment you would like to alter, as shown below.

## EQUIPMENT ACTIVITY ESTIMATION

|  | Year | Description | Fuel Type | SomerRatins | Hours | Air Conditioning |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Change | 2008 | Bore/Drill Rigs | Diesel | 175 | 59.1 | No |
| Change | 2008 | Cement \& Motar Mixers | 4 Stroke Gasoline (10\% Ethanol RFC | 11 | 0.0 | No |
| Change | 2008 | Dumpers/Tenders | 4 Stroke Gasoline (10\% Ethanol RFC | 11 | 11.5 | No |
| Change | 2008 | -oncrete/Industrial Saws | 4 Stroke Gasoline (10\% Ethanol RFC | 11 | 31.7 | No |
| Change | 2008 | Cranes | Diesel | 300 | 4.4 | No |
| Change | 2008 | Crushing/Proc. Equipment | Diesel | 75 | 0.0 | No |
| Change | 2008 | Crawler Tractors | Diesel | 175 | 0.0 | No |
| Change | 2008 | Excavators | Diesel | 175 | 119.7 | No |

The "Change" button will bring up a menu for selecting the equipment model year, fuel type and horsepower (which you must change in that order). Check the Air Conditioning box if the specific equipment model uses air conditioning.

To change the Hours of Activity, simply overwrite the previous value. There is no way to remove equipment from the list. If the equipment will not be used at all, specify 0 as the Hours of Activity.

Then click "Update."

## Section 3: Recyclables

The Recyclables worksheet displays a list of recycled materials that will give a credit against emissions if used in the project. The amount of each material used in pounds should be entered in the respective cell. Pressing the 'Calculate Recycled Materials Credit' button will update the Recycled Materials Credit totals to reflect the amount of the credit. Pressing Reset returns all values to zero. Total emissions can be viewed in grams or metric tons.

## Section 4: Lifecycle Maintenance

The Lifecycle Maintenance section is designed to estimate direct and upstream emissions based on expected materials and equipment that will be used in maintaining the completed product over its lifespan. Bridge lifecycle maintenance is not estimated in the current version.

Each field in the steps below is populated with default values that may be changed.

Step 1: Select the Pavement Type from the dropdown (Asphalt, Concrete, or Asphalt Overlay Concrete)

Step 2: Enter the Length of the project in miles.
Step 3: Enter the number of Lanes
Step 4: Enter the Pavement Depth (in inches) of the main roadway
Step 5: Enter the Combined Width (in feet) of both shoulders of the roadway
Step 5: Enter the Pavement Depth for the shoulders of the roadway
Step 6: Enter the distance (feet) for Transverse Joint Spacing (Step 6 does not apply when the Pavement Type is Asphalt).

Click "Update Maintenance."

## Section 5a: Staging

## Transportation

The Staging worksheet allows emissions to be estimated for activities involved in staging the construction site. The first box, Transportation, is similar in function to the Equipment worksheet, except with on-road vehicles.

Step 1: Select the vehicle type
Step 2: Select the year the vehicle was manufactured
Step 3: Select the type of fuel used
Step 4: Enter the one way distance of a trip with that vehicle type
Step 5: Enter the number of one way trips made with that vehicle type
Step 6: Enter the number of vehicles of that type
Step 7: The 'Add Item' button will add a line item on the spreadsheet with emissions factors (in grams) for that item, and updates the total emissions for all equipment.

To assist in determining distance traveled, a quick Distance Calculator box accepts the input of a starting and ending 5-digit zip code; clicking the 'Find Distance' button will bring up the user's web browser with a Google Maps page giving the driving miles between the two zip codes.

## Construction Site Lighting

The second part of calculating construction staging emissions involves estimating the use of lighting for nighttime work at the site. By default, the power is generator based. In this event, please verify that generators were added as equipment items in Section 2.

If the power is grid-based, choose that option in the drop down box. The sheet then prompts for the number of fixtures, watts per fixture, and operating hours per day. Multiple line items can be added. The operating hours box is prepopulated with an estimated figure based on the actual daylight hours expected based on the dates of the project. This default number can be changed if desired. Pressing the 'Add Lighting' button creates a new line item on the spreadsheet with emissions factors (in grams) for that item, and updates the total emissions for all materials. Pressing Reset returns all values to zero. Total emissions can be viewed in grams or metric tons.

## Section 5b: Traffic Disruption

Section 5b estimates the emissions from six project staging options, which result in changes in traffic patterns that occur during roadway construction and maintenance. GASCAP classifies staging procedures as one of the following work zone types:

1. Work Zone Only No lanes closed, with workers present during construction for the duration of the project
2. Lane Closure One or more, but fewer than all, lanes are closed for the duration of the project
3. Intermittent Lane One or more, but fewer than all, lanes are closed during specific periods Closure each day or week, but otherwise open, for the duration of the project
4. Full Road Closure Road is fully closed (all lanes) for the duration of the project, with a signed diversion route
5. Combination Road and Road is fully closed (all lanes) during specified periods each day or Lane Closure
6. Intermittent Road Closure

Road is fully closed (all lanes) during specific periods each day or week, with a signed diversion route, but otherwise open, for the duration of the project
7. Intermittent Work Zone No lanes closed, with workers present during construction during specific periods each day or week, for the duration of the project

Traffic flow changes in GASCAP are based on calculations from the 2010 Highway Capacity Manual. Because different emissions impacts must be calculated for each staging procedure, this is the most complex module in GASCAP. Some staging procedures will require entering additional data, as noted in the procedures below.

Step 1: Select the Staging Option from the dropdown menu

Step 2: Click the Enter Details Button to open the Work Zone details window.

Step 3.1: Enter the following Descriptions of the roadway at the site of the Work Zone:
a. Name of the roadway
b. Length (in miles) of the segment of the roadway affected by the work zone
c. The functional class of the roadway at the work zone.

Note: Selecting a functional class will populate default values for Physical Characteristics of the roadway. These may be changed in Step 3.4
d. The number of lanes per direction of that road segment at the work zone
e. The Annual Average Daily Traffic (AADT) for the roadway

Step 3.2: Accept Default Values for the Single Base Lane Capacity of the Work Zone, or enter:
a. The dominant direction of traffic flow at the work zone
b. The total flow at the work zone
c. The opposite direction flow at the work zone is then calculated automatically

Step 3.3: Enter the Intermittency schedule for intermittent lane/road closures:

Note: Step 3.3 applies only for intermittent work zones. During Step 1, if you selected any staging options other than 3 (Intermittent Lane Closure), 5 (Combination Road and Lane Closure), 6 (Intermittent Road Closure) or 7 (Intermittent Work Zone) this section will appear as "grayed out" and the fields will be inactive.
a. The number of days per week the lane/road closure is expected to take place
b. The start time at which the lane/road closure is expected to begin each day
c. The finish time at which the lane/road closure is expected to end each day.

Step 3.4: Enter the following Physical Characteristics of the Roadway around the site of the work zone:
a. The lane width (in US Feet)
b. The posted speed limit (in miles per hour)
c. Select TRUE if there is a median within the work zone; otherwise select FALSE
d. The number of ramps per mile within the work zone plus three miles upstream and downstream of the work zone for Freeways, or the number of access points per mile (driveways and unsignalized intersections within the work zone for other road types)
e. The lateral clearance (shoulder width) on the left and right sides of the roadway at the work zone
f. The directional split of traffic (proportion from 0.00 to 1.00 of traffic flowing in the
dominant direction) at the work zone
g. The grade (either Level, Rolling, or Mountainous) of the roadway at the work zone
h. No passing Lane - Level
i. No Passing Lane - Rolling
j. Whether the work zone is in an Urban or a Rural location

Step 3.5: Click the Update Values button.
Step 4: Accept the default values or enter custom values for the proportion (from 0.000 to 1.000) of vehicles using the roadway that are:
a. Passenger Cars
b. Trucks or Buses
c. Recreational Vehicles (RVs)

Note: Entered values must add up to 1.000
Click "Update Values."

If staging procedure 1 (Work Zone Only) is selected, this is all of the information that is required.

If staging procedure 2 (Lane Closure), $\mathbf{3}$ (Intermittent Lane Closure) is selected, you will be prompted to enter the number of lanes affected by closures in the following dialogue:

Step 5.1: Enter the number of lanes to be closed in the dominant direction. The maximum number of lanes that can be closed is one less than the total number of lanes in the work zone. If all of the lanes are to be closed, this would be classified as a Road Closure.
selected, you will be prompted to enter further information for establishing a detour.

Step 6.1: Enter the number of links $(1-5)$ for the signed diversion route resulting from any road closures.

Step 6.2: Enter the following details for each diversion route link into the dialogue box shown below:
a. Enter the Description, Single Lane Base Capacity, and Physical Characteristics for each link in the detour, as in Step 3
b. Accept, for each detour link, the default values or enter custom values for the proportion (from 0.000 to 1.000 ) of vehicles using the roadway that are:

1) Passenger Cars
2) Trucks or Buses
3) Recreational Vehicles (RVs)

Note: Entered values must add up to 1.000

If staging procedure 5 (Combination Road and Lane Closure) is selected, you will be prompted to enter information about BOTH a road closure with detour and a lane closure. Refer to Steps 5.1-6.2.

## Section 6: Lighting

The Lighting worksheet estimates direct emissions from traffic lights and street lights that are installed as part of the project over their operating lifespan.

Step 1: Select the lighting type
Step 2: Select the power rating for the light if necessary
Step 3: Enter the number of lamps or signal heads
Step 4: Enter the anticipated number of operating years
Pressing the 'Add Item' button creates a new line item on the spreadsheet with emissions factors (in grams) for that item, and updates the total emissions for all materials. Pressing Reset returns all values to zero. Total emissions can be viewed in grams or metric tons.

## Section 7: Rail

Section 7 estimates emissions from the construction of railway projects.
Step 1: Select the category of rail item to
be added.
Step 2: Select the specific item within that category.

Step 2 will determine the remaining steps, dependent on the variables involved with the selected item. Variables for specific items include:

Joint Bars: When selecting joint bars, the user will be prompted for rail length in order to determine how many joint bars are required. Rail length options are 39 feet, 80 feet, or continuous. If continuous is selected, the user will be prompted to enter the continuous rail length.

Timber Ties: For timber ties, the user is prompted to choose a timber disposal method. The disposal method will result in a credit against emissions due to either the burning of the timber as fuel or the storing of it in a landfill (carbon sequestration).

For all items that are dependent on length of track, the user will be prompted to enter the number of parallel tracks. As most items require an input in feet, there is a simple calculator on the page that can be used to convert miles into feet. Pressing Reset returns all values to zero. Total emissions can be viewed in grams or metric tons.

2. Select specific item:

| RAIL TOTALS | Change Unit |  |
| :--- | :---: | :---: |
|  |  |  |
| Direct $\mathrm{CO}_{2}$ | 0.00 | $(\mathrm{~g})$ |
| Upstream and Disposal $\mathrm{CO}_{2}$ | 0.00 | $(\mathrm{~g})$ |
| Upstream and Disposal $\mathrm{CH}_{4}$ | 0.00 | $(\mathrm{~g})$ |
| Upstream and Disposal $\mathrm{N}_{2} \mathrm{O}$ | 0.00 | $(\mathrm{~g})$ |
| Total $\mathrm{CO}_{2}$ Equivalent | 0.00 | $(\mathrm{~g})$ |
|  |  |  |

RAIL ITEMS ADDED

## Section 8: Induced Travel

Section 8 of GASCAP estimates the additional impact of mobile emissions from induced travel -the increase (or decrease) in travel activity that occurs in response to adding (or removing) capacity from a roadway, assuming that the project life is 50 years.

 Ready 9

Step 1: Select "Yes" if the project has either added or reduced road capacity; otherwise select "No."

Step 2: Enter the additional capacity in lane-miles for each class of road (Expressways/Freeways/Interstates, Arterial Roads, Collector Roads, Local Roads) that will result from the project. If capacity has been reduced, enter the change as negative lane-miles.

## Results

The Results worksheet displays the cumulative results from all sections of GASCAP. In addition to results from each individual section, the worksheet contains emission estimation totals for the entire project, and an estimated fuel consumption box based on the Equipment and Staging sections. Current fuel prices can be entered and the total cost updated by pressing the 'Update Fuel Costs' button. The 'Print Results' button will print all results in a two page format.

## Maintenance Department Module

GASCAP's Maintenance module addresses planned rehabilitations of NJDOT facilities, but not routine maintenance, such as pothole filling and crack sealing. To address this gap, GASCAP includes a special module for estimating direct and upstream emissions from equipment fuels and materials from routine maintenance activities to enable a more complete life-cycle analysis with respect to capital projects. The results from this data gathering module are treated as separate section from other GASCAP modules.

## Maintenance Equipment

Step 1: Click the "Equipment" radio button to begin adding equipment.
Step 2: Enter (in the following order) the type; quantity of pieces; model year; fuel; time spent idling; miles travelled; horse power rating; and air conditioning for each equipment item you would like to add. Not all fields are applicable to every equipment item, and may appear grey.

Step 3: Click "Update Maintenance" to add equipment. The item will appear in list the bottom of the spreadsheet (once for running emission and once for idling emissions). Click the "Remove" button to the right of the item to remove it from the equipment list.

## Maintenance Materials

Step 1: Click the "Materials" radio button to begin adding materials.
Step 2: Enter (in the following order) the type; heating temperature; outdoor ambient temperature; quantity; percentage of binder; percentage of aggregate moisture; and solvent type for each material item you would like to add. Not all fields are applicable to every material and may appear grey.

Step 3: Click "Update Maintenance" to add materials. The item will appear in list the bottom of the spreadsheet. Click the "Remove" button to the right of the item to remove it from the materials list.

## Viewing and Saving Detailed Results

A summary of the maintenance emissions appears on main worksheet. You can also view emissions separately for materials; generators; idling vehicles; and running vehicles. To see separate results, click "View Detailed Results" to navigate to the results page.

Clicking "Save" on the data entry sheet opens a dialogue to save the results in a new workbook. The first sheet will contain the list of equipment and materials. The second
sheet will contain detailed results from the module. Once the results are saved, the module will automatically reset.

CURRENT MAINTENANCE RESULTS

| Materials |  |  |  |
| :---: | :---: | :---: | :---: |
| Direct $\mathrm{CO}_{2}$ | 0.00 (g) | Upstream $\mathrm{CO}_{2}$ | 0.00 (g) |

## Section 9: Updating GASCAP

Periodically, it may be necessary to update GASCAP with new data with emissions factors, new vehicles, etc. There are several, password-protected modules which allow administrators to easily update the software.

There are 9 modules
for updating data in
GASCAP:

- Section 9a: Update Global Warming Potential Values
- Section 9b: Process Fuels
- Section 9c: Electricity Production
- Section 9d: Steel
- Section 9e: Other Materials
- Section 9f: Equipment Year
- Section 9g: Staging
- Section 9h: Induced Travel

Before updating Sections 9b-9e, it is necessary to extract new emissions factors from the latest version of Argonne National Laboratory's GREET model. For detailed instructions for obtaining these factors, see the Technical Memorandum Updating GASCAP with Revised Greet Vehicle and Fuel Cycle Values.

Other Sections may require extracting data from other models, such as NONROAD or MOVES. This will be noted in the instructions for updating these sections.

## Accessing the Update Modules

To access GASCAP's updating modules, type the administrator password into the box on the Project Info tab.

Click Confirm Password. If the password is correct, the confirmation window to the right will appear.

Click OK. Then click
the Section 9:

Password Confirmation $\quad$ ES

That is the correct password

Admin button.

## Section 9a: Global Warming Potential Values

Click the "Section 9a: Update GWP Values" button at the top of the screen to navigate to the correct worksheet. To update GWP values, replace the existing values for Methane, Nitrous Oxide, Hexafluoride, and HFC-134a. Then click the "Update GWP" button at the bottom.

| GWP Values |  |
| :---: | :---: |
|  | value |
| Carton Dioxide | 1 |
| methane | 25 |
| Nitrous Oxide | 298 |
| Sulfur Hexafluoride | 22.800 |
| HFC. 134 a | 18 |

3. Input Nitrous Oxide GWP
HFC. 134a
18
4. Input Sulfur Hexfluoride GWP
5. Input HFC-134a GWP

Update GWP
5. Input HFC-134a GWP

## Section 9b: Process Fuels Emissions

## Factors

GASCAP allows you to update upstream emissions and combustion emissions for process fuels. Click the
"Section 9b: Process Fuels" button to navigate to the correct updating worksheet, shown below.

SECTION 9b: PROCESS FUELS
Enter Prolest Tide Here

1. Enter admin password (Project Info tab) (This only needs to be done once per GASCAP session)
2. Click Update Process Fuels Upstream Emissions or Update Process Fuels Combustion Emissions

3. Enter revised values in form
4. Click Update Factors

To update the upstream emissions, click the "Update Process Fuels Upstream Emissions" button. Enter new values for each greenhouse gas and process fuel in the dialogue box shown below. Click Update Factors.

To update the combustion emissions, click the "Update Process Fuels Upstream Emissions Button." Enter new values for each greenhouse gas and process fuel in the dialogue box shown below. Click Update Factors.

## Section 9c: Electricity Production Emissions Factors

Click the "Section 9c: Electricity Production" button to navigate to the correct worksheet, shown below.

First click the "Update Energy Sources for Electricity" button to update the mix of fuels used to generate electricity. The dialogue below will appear.

Select your region to load default data, either the United States Average or for Northeast. Enter the new values and click Update Factors.

Click the "Update Transmission Loss" button, opening the dialogue box below. Enter the new value for the percentage of electricity lost in transmission. Click Update Factor.

Click the "Update Energy Emissions for Electricity" button to open the updating dialogue box shown below. Select a region to load the default data for either the United States Average or the Northeast. Enter the new emissions factors in grams per million BTUs. Click Update Factors.

## Section 9d: Emissions Factors for

## Steel

Click the "Section 9d: Steel" button to navigate to the worksheet for updating emissions factors associated with virgin and recycled steel, shown below.

1. Enter admin password (Project Info tab) (This only needs to be done once per GASCAP session)
2. Click Update Virgin Steel Emissions Factors or Update Recycled Steel Emissions Factors

3. Enter revised values in form
4. Click Update Factors

To update factors for virgin steel, click the "Update Virgin Steel Emissions Factors" button. Enter the new values in the dialogue box shown below. Click "Update Values."

|  |  |  |  |  |  |  | ${ }^{x}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Ore Recovery | Ore Pelletizing and Sintering | Coke Production | Blast Furnace | Basic 02 <br> Furnace | Electric Arc Furnace | Sheet Production \& Rolling | Stamping |
|  | ghe ufs.xul | ghe uf sieul | ghe uf s:ewl | ghe uf s.exl | ghe uf s:exl | ghe uf s :ut | ghe uf sieul | ghe ul s:exl |
| $\mathrm{CO2}$ | 25,950] | 2mi,6n | 14 a, , 19 | 1,760, 16\% | 1,2017, 16i | 05.7\% | P-R,AT | [ 27 , 4 \% |
| CH 4 | > 47 | 751.49 | 290.4i | matini | Rai.na | 27.77 | 1,7\% | 1,7946 |
| N20 | \% | 1.nn | 1.07 | (1) | 1.01 | 1. 4 | 1. m | ค.17 |
| Update Valuess |  |  |  |  | Cancul |  |  |  |

To update factors for recycled steel, click the "Update Recycled Steel Emissions Factors" button. Enter the new values in the dialogue box shown below. Click "Update Values."

## Section 9e: Emissions Factors for Other Materials

Click the Section 9e: Other Materials button to navigate to the worksheet for updating emissions factors associated with plastics or other materials,

1. Enter admin password (Project Info tab) (This only needs to be done once per GASCAP session)
2. Click Update Plastics Emissions Factors or Update Other Materials Emissions Factors
3. Enter revised values in form
4. Click Update Factors
shown below.

Click the "Update Plastics Emissions Factors" button. Enter the new values for carbon dioxide, methane, and nitrous oxide emissions (in grams per ton) for each plastic product type in the dialogue box shown below. Click "Update Values."

Click the "Update Other Materials Emissions Factors." Enter the new values for carbon dioxide, methane, and nitrous oxide emissions (in grams per ton) for each other material product type in the dialogue box shown below. Click "Update Values."

235

## Section 9f: Equipment Data

GASCAP can be updated with new models of construction equipment. Emissions factors for new equipment must be extracted from EPA's NONROAD model. VTC has prepared scripts for extracting this data using MySQL. See the Technical Memorandum "Updating Equipment Data in GASCAP" for step by step directions for preparing a spreadsheet with updated equipment data for new model years. Then follow the instructions below.

Click the "Section 9f: Equipment" button to navigate to the worksheet for updating

1. Enter admin password (Project Info tab) (This only needs to be done once per GASCAP session)
2. Input Most Recent Year

3. Click Update Equipment button
4. Paste data into worksheet created
5. Save then re-open GASCAP
equipment, shown below.

Enter the most recent year for new equipment in the box labeled Input Most Recent Year. Click Update Equipment. This will create and open a new worksheet tab called "20xx Data," as shown below.

Copy and paste the data from the spreadsheet created using NONROAD into the "20xx Data" worksheet. Save and then re-open GASCAP.

You do not need to do anything else. GASCAP will then be able to estimate emissions from new construction equipment.

## Section 9g: Staging Emissions

## Factors

Before updating Staging emissions factors, it is necessary to extract updated data from the latest version of EPA's MOVES software. See the Technical Memorandum "Updating Staging Emissions Factors in GASCAP" for detailed instructions for creating a spreadsheet with updated data.

Click the "Section 9g: Staging" button to navigate to the worksheet for updating emissions factors associated with transportation of vehicles and personnel to and from construction sites, shown below.

Click the Update Staging Factors button to create and open a new worksheet tab called "Staging Data Update," shown below.

Copy and paste the updated data from the spreadsheet created with MOVES into the "Staging Data Update" worksheet. Then click the "Update Staging Data" button.

## Section 9h: Induced Travel Emissions Factors

Before updating Induced Travel emissions factors, it is necessary to extract updated data from the latest
version of EPA's MOVES software. See the Technical Memorandum "Updating Induced Travel Emissions Factors in GASCAP" for detailed instructions for creating a spreadsheet with updated data.

Click the Section 9h: Induced Travel button to navigate to the worksheet for updating emissions factors for Induced Travel, shown below.

1. Enter admin password (Project Info tab)
(This only needs to be done once per GASCAP session)
2. Check default file path for induced travel emission factors (and change if necessary) (This is set to the directory GASCAP is currently saved in)
3. Click Update Induced Travel Emissions Factors button

Locate the spreadsheet created with MOVES on your computer. Copy and paste complete file path into the box provided.

Click the "Update Induced Travel Emissions Factors" button.

[^0]:    ${ }^{1} \mathrm{k}$ specifies the number of rows. It is situation specific so that there is no need to plan for updating to read data from specific rows.
    ${ }^{2} \mathrm{x}$ also specifies the number of rows. It is must be designed as a variable so that it increases with each column move to the right. Planning is needed for updating to reading data from specific rows.

[^1]:    ${ }^{3}$ [SCC] references whichever column is labeled SCC. The user should enter the corresponding letter in its place.

[^2]:    ${ }^{4}$ [SCC] references whichever column is labeled SCC. The user should enter the corresponding letter in its place.

[^3]:    ${ }^{5}$ In this case the row name last refers to the last row of data in the subtable it references, i.e. VTRTMY)
    ${ }^{6} \mathrm{Tip}$ - Use the arrow keys and the Shift and Control keys to enter the cell references. In the parentheses type only the commas. Then add the dollar signs.

[^4]:    ${ }^{7}$ In this case the row name last refers to the last row of data in the subtable it references, i.e. VTRTMY)
    ${ }^{8} \mathrm{Tip}$ - Use the arrow keys and the Shift and Control keys to enter the cell references. In the parentheses type only the commas. Then add the dollar signs.

[^5]:    ${ }^{9} \mathrm{Tip}$ - Use the arrow keys and the Shift and Control keys to enter the cell references. In the parentheses type only the commas. Then add the dollar signs.
